Centyr — Grand Slam Offer Build

Offer Name: The Centyr Catalog Standard

0. Reframe Note (read first)

Earlier versions of this offer collapsed Centyr into a single wedge — "EU Amazon sellers rejected by Zalando because Amazon wants square and Zalando wants portrait." That format conflict is a real, nameable pain, but it is **one angle, not the offer**. The offer is rebuilt here around the **full value**, which has three pillars, with **catalog uniformity over time** as the primary moat.

Pillar 1 — Catalog uniformity over time (THE CORE MOAT). Centyr aligns, centers, sizes, removes background, and normalizes exposure across a whole catalog so every product photo matches — the "align 200 products on a grid in Canva (20 hours), but automatic" job. Crucially it is a **reproducible standard that holds as the catalog grows and changes**: add a new product three months later and it auto-matches the existing 500; change a margin or format and reprocess the entire catalog in one click. A Fiverr freelancer or manual Canva work must redo everything each time; Centyr keeps the catalog uniform over time. This is the main value.

Pillar 2 — Multichannel compliance (one angle, not the spine). One upload outputs marketplace-compliant images per platform (Amazon 1:1 square, Zalando 2:3 portrait, eBay, Etsy) plus your own store. The Amazon-vs-Zalando conflict is a strong pain to name for the multichannel subset — not the whole offer.

Pillar 3 — Done-for-you compliance ("we handle it"). Centyr keeps up with each store's exact image spec so the seller never has to know, track, or maintain them. "We stay compliant with every marketplace's spec so you don't have to think about it." Peace-of-mind value.

1. Business Snapshot

- **What the business does:** SaaS that turns a raw product-photo library into a single, consistent, marketplace-ready catalog — and keeps it consistent over time. Centyr aligns, centers, sizes, removes background (BiRefNet, strong on glass/reflective/transparent), and normalizes exposure across a whole catalog so every product photo matches, then outputs the right format for every channel from one upload.
- **What is being sold:** Subscription access to the Centyr catalog processor, positioned as **The Centyr Catalog Standard** — set your look once, every product matches it, every new product auto-matches, on every marketplace, and you reprocess the whole catalog in one click whenever your standard changes.
- **Current stage:** Solo founder, pre-revenue, zero marketing budget. Product ~80% built and in production (backend on AWS, web on Vercel). Distribution — not product — is the bottleneck. No customers yet: no testimonials, case studies, or client logos exist and none are fabricated here. Proof = the product works + a before/after of the prospect's own catalog.
- **Main channel (zero budget):** Cold outreach with a personalized before/after of the prospect's own catalog; a free "try your hardest products" tool as top-of-funnel; Fiverr/Upwork gigs delivered with Centyr and converted to subscription; seller communities; agencies as multipliers.

2. Target Market

- **Market:** E-commerce catalog image standardization + multichannel compliance tooling (not "AI background remover" — that is a commodity Fiverr sells at €5/25 images).
- **Primary segment:** E-commerce sellers, brands, and artisans with a **real catalog (dozens–hundreds of SKUs) that updates seasonally and must stay visually uniform over time** — selling on Amazon / eBay / Etsy / Zalando and/or their own Shopify/store. The pain is "my catalog looks like it was shot by five different people, and every new product breaks the grid again."

- **High-value subset:** Multichannel sellers who must satisfy incompatible marketplace specs simultaneously (e.g. Amazon square + Zalando portrait). Acute, nameable, financial — but a subset, not the whole market.
- **High-ARPA multiplier: Agencies and product-photo studios managing many client catalogs.** One agency = many catalogs that all need a persistent, reproducible standard → Business tier. This is the throughput multiplier that lifts average revenue per account.
- **Not for:** Hobbyist Vinted/Depop sellers with 5 items — no volume pain, no uniformity problem over time, won't pay.

3. Ideal Customer Avatar

One-sentence avatar: An operator responsible for a growing product catalog (a brand owner, a marketplace seller, an artisan scaling up, or an agency/studio managing client catalogs) who needs every product photo to match every other one — now and as the catalog keeps growing and changing — across every channel they sell on, without doing it by hand every time.

Current situation:

- Manages dozens–hundreds of SKUs, adds new products regularly, refreshes the catalog seasonally.
- Photos were taken at different times, on different days, at different distances — so sizes, centering, backgrounds, and exposure drift across the catalog.
- Either aligns them by hand in Canva/Photoshop (the validated case: ~200 products = ~20 hours ≈ €300 of manual work), or pays a Fiverr/VA who has to be re-briefed and redoes everything from scratch each cycle.

If multichannel: also fights incompatible marketplace formats (square vs portrait) and tracks specs that change.

Pain points:

- **The catalog is not uniform.** Product photos don't match each other — different sizes, off-center, mismatched backgrounds and exposure. It looks amateur next to bigger brands.
- **Every new product breaks the grid.** Adding SKUs three months later means re-doing alignment so the newcomers match the existing set — there is no persistent standard.
- **Every change means redoing everything.** Decide on a new margin, a new background, a new size? Manual work and Fiverr both start over on the whole catalog.
- **Manual alignment is a time sink.** ~20 hours to grid ~200 products in Canva; it comes back every season and every new drop.
- **Freelancers are inconsistent and non-reproducible.** Different editor, different result; no standard is retained; re-briefing overhead every cycle.
- **Multichannel (subset):** incompatible specs (Amazon 1:1 vs Zalando 2:3) force a second full pass per platform.

Spec-tracking burden: each marketplace publishes exact requirements that change; keeping up is a job nobody wants.

Failed attempts:

- Manual Canva/Photoshop grid — works once, but must be redone every time the catalog grows or a standard changes; no batch, needs skill.
- remove.bg / generic bg-removers — strip the background but don't center, size, normalize exposure, or hold a standard across the catalog; one format only.
- Fiverr / VA — inconsistent, no retained standard, re-briefed every cycle, human error on specs.

Photo studio — expensive per image, slow, and still no reproducible standard you own.

Desired outcome: A catalog where **every product photo matches every other**, that **stays matched as new products are added and the catalog changes**, and that **outputs correctly for every channel** — achieved once, then maintained in one click, with no design skill and no spec-tracking.

4. Dream Outcome (Hormozi Value Equation — maximize)

Primary outcome: A permanently uniform catalog. Every product photo aligned, centered, sized, background-clean, and exposure-matched to one standard — a standard that **auto-applies to every new product** and can be **re-applied to the entire catalog in one click** whenever it changes, and that **exports correctly for every marketplace and your own store**.

Emotional outcome: Relief and control. The catalog stops being a recurring chore and an embarrassment. The operator stops improvising every season and stops worrying whether the newest product "matches." They feel like they run a real brand with a real

system.

Status shift: From "seller whose catalog looks stitched together" to "brand whose catalog looks like a big, well-run operation" — on every channel, and it stays that way as the catalog grows.

Outcome statement: "Set your catalog's look once. Every product matches it, every new product auto-matches, every marketplace gets the right format — and when your standard changes, your whole catalog updates in one click."

5. Obstacles (and how the value equation neutralizes each)

1. Photos drift — different size, centering, background, exposure across the catalog → **alignment + centering + sizing + bg removal + exposure normalization to one deterministic standard** (Pillar 1).
2. Adding new products later breaks uniformity → **new products auto-match the existing standard** (Pillar 1, moat).
3. Changing the standard means redoing everything → **one-click reprocess of the entire catalog** (Pillar 1, moat; paid-only feature).
4. Manual alignment is ~20 hours per ~200 products → **~10 minutes automated** (Time Delay collapse).
5. Freelancers are inconsistent and non-reproducible → **deterministic standard the customer owns and keeps** (Effort + Likelihood).
6. Complex products (glass, jewelry, reflective, transparent) → **BiRefNet, chosen specifically for these edge cases** (Likelihood).
7. Multichannel format conflict (square vs portrait, subset) → **one upload, per-marketplace compliant outputs** (Pillar 2).
8. Nobody wants to track changing marketplace specs → **Centyr maintains the specs; done-for-you compliance** (Pillar 3).
9. No design skills → **upload/download, zero configuration** (Effort).
10. Trust that AI output is good enough → **try your hardest products free + before/after of your own catalog + 30-day money-back** (Likelihood; honest, no fabricated proof).
11. Agencies/studios: many client catalogs, labor-bound → **one standard per client workspace, reprocessed in one click, high throughput without hiring** (multiplier).

6. Solution Map

Obstacle	Solution	Pillar	Plan gating
Catalog not uniform (size/center/bg drift)	Align + center + size + background removal to one standard	1	Alignment + bg removal: all plans
Exposure/lighting drift across catalog	Exposure normalization to a catalog standard	1	Pro+
New products don't match the existing set	Standard auto-applies to every new upload	1 (moat)	All plans (the standard); reprocess to re-baseline: paid-only
Standard changes (margin/format/background)	One-click reprocess of the whole catalog	1 (moat)	Reprocess: paid-only
Clean, consistent look on complex products	BiRefNet bg removal (glass/reflective/transparent)	1	All plans
Incompatible marketplace formats	One upload → per-marketplace compliant outputs	2	Presets: Starter 1 / Pro+ all
Consistent, on-brand shadow	Shadow generation	1/2	Starter+
Brand/store look beyond marketplace defaults	Custom background	1	Paid-only
Tracking each store's changing specs	Centyr maintains specs; you don't think about it	3	Built into presets
No design skill / no time	Upload → process → download, zero config	all	All plans

Many client catalogs (agency/studio)	Per-client standard, batch, one-click reprocess	1 + multiplier	Business (highest volume/batch)
--------------------------------------	---	----------------	--

7. Core Offer

- Offer name:** The Centyr Catalog Standard

Tagline: Set your look once. Every product matches — and stays matched.

What's included:

- Pillar 1 — The Standard Engine (core):** align, center, size, remove background (BiRefNet), and normalize exposure across your whole catalog to one reproducible standard. New products auto-match it; change the standard and reprocess the entire catalog in one click.
- Pillar 2 — Multichannel outputs:** one upload → Amazon (1:1 square), Zalando (2:3 portrait), eBay, Etsy, and your own store — each compliant, from the same source.
- Pillar 3 — Done-for-you compliance:** Centyr keeps up with each marketplace's exact image spec so you never track or maintain them.

Shadow generation, custom background, and marketplace presets per plan gating (see PRICING.md).

Format: SaaS web app, browser-based, no install.

Delivery: Instant access on signup. Upload → process → download in one session. Your standard is saved and re-usable.

Time to first win: A single product processes in ~21 seconds (observed). A ~200-product catalog aligns to one standard in ~10 minutes — versus ~20 hours by hand (≈ €300 of manual work). (Current worker: BiRefNet, ~40s/image on CPU.)

8. Bonus Stack (honest, delivery-light — no fabricated proof)

Bonuses are real, buildable assets that de-risk adoption. None imply existing customers or results.

Bonus	Purpose	Est. standalone value
Your Catalog Before/After — we run a sample of your own products (including your hardest ones) and send you the grid before you pay	This is the honest proof: it shows uniformity on <i>your</i> catalog, not someone else's testimonial	€90 (a Fiverr batch + an hour of manual alignment)
The Catalog Standard Blueprint — a short guide to defining your own standard (margin, background, size, exposure) once, so it holds across every future drop	Turns a one-time cleanup into a durable system the customer owns	€40
Marketplace Spec Reference — current Amazon / Zalando / eBay / Etsy image requirements, maintained inside the product so you don't track them	Makes Pillar 3 (done-for-you compliance) tangible	€40
Complex-Product Setup Notes — how to get the best BiRefNet result on glass, jewelry, transparent and reflective products	Removes the "AI won't work on my product" objection honestly	€30
Agency/Studio Workflow Pack — per-client workspace naming, one-click reprocess routine, batch structure for many catalogs	Unlocks the high-ARPA multiplier segment	€50

Total bonus stack value: ~€250 (all deliverable by a solo founder; no customer proof implied).

9. Value Stack

Component	Standalone value (honest basis)
The Centyr Catalog Standard — 12 months, Pro tier (€39.99/mo × ~10 = annual)	~€400/year
Manual alignment replaced (per ~200-product cycle, ~20h ≈ €300) × seasonal recurrence	€600–€1,200/year
Your Catalog Before/After	€90
Catalog Standard Blueprint	€40
Marketplace Spec Reference	€40
Complex-Product Setup Notes	€30
Agency/Studio Workflow Pack	€50
Total stacked value	~€1,250–€1,850/year
Actual Pro price	€39.99/month (annual = 10× monthly ≈ €400/year)

ROI anchor (honest, no invented numbers): One manual alignment pass on ~200 products costs ~20 hours (≈ €300). Centyr does it in ~10 minutes and then holds the standard as the catalog grows — so the saving repeats every season and every new drop, for €39.99/month.

10. Guarantee (honest, pre-revenue)

- **Primary — "Try your hardest products free":** Send us (or upload) your most difficult products — glass, jewelry, transparent, reflective. We process them and show you the before/after on *your own* catalog before you pay a cent. If it doesn't make your catalog look uniform, you walk away.
- **Secondary — 30-day money-back:** Subscribe, process your real catalog, and if within 30 days it hasn't given you a uniform, reproducible catalog standard, email us for a full refund. No case studies required — the product proves itself on your products.
- **Why this is the right guarantee at this stage:** With no customers yet, the only credible proof is the product working on the prospect's own catalog. The free hardest-products trial *is* the acquisition mechanism and the risk reversal at once; the 30-day money-back covers paid conversion. Neither relies on testimonials that don't exist.

11. Positioning

- **Who it's for:**
- E-commerce sellers, brands, and artisans with real, growing catalogs (dozens–hundreds of SKUs) that must stay visually uniform over time.
- Multichannel sellers juggling incompatible marketplace specs (high-value subset).

Agencies and product-photo studios managing many client catalogs (high-ARPA multiplier).

Who it's NOT for:

- Sellers with a handful of items and no uniformity-over-time problem.
- Buyers wanting lifestyle/creative staging or AI-generated scenes.

Teams with a full in-house production pipeline that already enforces a standard.

Unique angle: The only tool that turns your catalog into a **reproducible standard that holds over time** — new products auto-match, one-click reprocess when the standard changes — and then outputs it compliant for every channel. Competitors (PhotoRoom, remove.bg, Claid, Pixelcut, Pebblely) do single-image creative editing; none maintain a persistent catalog standard.

Positioning statement: "The Centyr Catalog Standard — set your product-photo standard once; every product matches it, every new product auto-matches, every marketplace gets the right format, and one click re-applies it to your whole catalog whenever it changes."

Key differentiators:

- vs. manual Canva/Photoshop: batch, zero-skill, and the standard persists — you don't redo it every drop.
- vs. Fiverr/VA: reproducible standard you own, no re-briefing, consistent every time.
- vs. remove.bg / PhotoRoom / Pixelcut: they do single-image creative; none hold a catalog-wide standard over time or do multichannel compliance from one source.

vs. studio: no per-image cost, minutes not days, and the standard is yours to re-apply.

Category: Catalog standardization + multichannel compliance engine (not a background remover, not a photo editor).

12. Delivery Model

- **Model:** DIY SaaS where the AI does the skilled work — from the customer's side it feels done-for-you (upload → download), which is the effort-reduction leg of the value equation. The persistent standard (auto-match new products, one-click reprocess) is what a DFY human service structurally can't match at this price: a freelancer redoes the work each time; Centyr retains and re-applies the standard.

13. Value-Equation Summary

- **Dream Outcome** (↑): a permanently uniform, professional catalog on every channel that stays uniform as it grows — brand-level look without a production team.
- **Perceived Likelihood of Achievement** (↑): BiRefNet on hard products, a deterministic standard, before/after on the prospect's *own* catalog, "try your hardest products free," 30-day money-back. Honest proof, no fabricated testimonials.
- **Time Delay** (↓): ~200 products aligned in ~10 min vs ~20 hours; single product ~21s; new products auto-match instantly; whole-catalog reprocess in one click.
- **Effort & Sacrifice** (↓): no Canva grid, no Photoshop, no Fiverr re-briefing, no spec-tracking — the standard is set once and maintained for you.

14. Launch Notes (zero budget)

- **Lead pillar:** uniformity-over-time (Pillar 1). Open cold outreach with a before/after of the prospect's *own* catalog — the highest-signal asset available and the only honest proof at pre-revenue stage.
- **Name the multichannel pain (Pillar 2) as one hook among several** for the multichannel subset — not the spine of every message.
- **Sell Pillar 3 (done-for-you compliance)** to buyers who are tired of tracking specs.
- **Target agencies/studios** with the workflow pack and one-click reprocess — the ARPA multiplier and Business-tier driver.
- **Do not fabricate proof.** Proof = the product works + the prospect's own before/after. See OFFER_ANGLES.md for the full angle set and VALUE_PERCEPTION.md for framing; HOOKS.md / PITCH.md / LANDING_PAGE.md are handled in a separate pass.

OFFER_ANGLES

OFFER_ANGLES.md

Centyr — Positioning Angles

Offer: The Centyr Catalog Standard

Base Offer

- **Who:** E-commerce sellers, brands, artisans, and agencies/studios with real, growing catalogs (dozens–hundreds of SKUs) that update seasonally and must stay visually uniform over time — on Amazon/eBay/Etsy/Zalando and/or their own store. Multichannel sellers are a high-value subset; agencies/studios are the high-ARPA multiplier.
 - **What:** Turn a catalog into a reproducible standard — align, center, size, remove background, normalize exposure so every product matches — that holds over time (new products auto-match; one-click reprocess when the standard changes) and outputs compliant for every channel from one upload.
 - **Reframe rule:** Lead with **uniformity over time** (the moat). The Amazon-vs-Zalando format conflict is **one angle for the multichannel subset** — not the spine of every message.
-

The Angle Set

Angles are grouped by the three pillars, moat first.

PILLAR 1 — Catalog uniformity over time (primary)

Angle A: Uniformity-over-time (LEAD ANGLE)

The core promise: every product photo matches, and stays matched as the catalog grows. - **V1:** "Your catalog looks like it was shot by five different people. Centyr aligns, centers, sizes, and evens out every product photo so they all match — and stay matched as you add more." - **V2:** "Set your product-photo standard once. Every product in your catalog matches it — automatically."

Angle B: Auto-match-new-products

The moat, made concrete: growth stops breaking uniformity. - **V1:** "Add a new product three months from now and it auto-matches the 500 already in your catalog. No re-aligning to keep up." - **V2:** "Your catalog grows. Your standard doesn't move. Every new SKU inherits it the moment you upload."

Angle C: Reprocess-in-1-click

Change is cheap; the standard is re-applicable. - **V1:** "Change your margin, size, or background and re-apply it to your entire catalog in one click. Fiverr and Canva would start over from zero." - **V2:** "Rebrand your whole catalog's look in one click — not one product at a time."

Angle D: Cost-vs-studio/Fiverr (reproducibility economics)

Why owning a standard beats renting labor. - **V1:** "Aligning ~200 products by hand takes ~20 hours (about €300 of work) — and you redo it every season. Centyr does it in ~10 minutes and keeps the standard so you never redo it." - **V2:** "A freelancer's result dies when the job ends. Centyr's standard is yours — and re-applies on demand, forever. Pro is €39.99/month."

PILLAR 2 — Multichannel compliance (one angle for the subset)

Angle E: Multichannel compliance

One standardized catalog, every platform's format — from one upload. - **V1**: "One upload becomes Amazon-square, Zalando-portrait, eBay, Etsy, and your own store — each compliant, from the same standardized catalog." - **V2**: "Sell everywhere without reformatting for everywhere. One source, every channel."

Angle E-Zalando: The format-conflict pain (named, but not the spine)

Use for the multichannel subset who feel the square-vs-portrait conflict acutely. - **V1**: "Amazon wants square. Zalando wants portrait. Instead of two manual passes, upload once — Centyr outputs both from the same source." - **V2**: "If Zalando rejected your images for being square, you don't need a reshoot. You need one catalog that outputs every marketplace's format." - **Note**: This is one hook among several. Do not build the whole offer on it.

PILLAR 3 — Done-for-you compliance (peace of mind)

Angle F: Done-for-you-compliance

We track the changing specs so the seller doesn't. - **V1**: "Every marketplace publishes its own image spec, and they change. Centyr keeps up with all of them so you never have to learn, track, or maintain a single one." - **V2**: "We stay compliant with every marketplace's spec so you don't have to think about it."

CROSS-CUTTING

Angle G: Agency/studio multiplier (high-ARPA)

Many client catalogs, each with its own persistent standard. - **V1**: "Managing catalogs for ten clients? Give each one its own standard, batch-process it, and reprocess it in one click when the client changes their mind — without hiring." - **V2**: "Turn per-image retouching labor into per-catalog standards you can re-run on demand. One operator, many catalogs, one throughput multiplier."

Angle H: Effort/identity

- **V1**: "No Canva grid. No Photoshop. No Fiverr re-briefing. No spec sheets. Upload your catalog, download a matching one."
- **V2**: "Run your catalog like a real brand — one consistent standard, maintained automatically — instead of improvising every season."

Top 3 Angles

1. Angle A — Uniformity-over-time (LEAD). Why it works: It names the pain every catalog operator feels regardless of channel — the catalog doesn't match — and it's the broadest, most honest promise. It opens the whole market (sellers, brands, artisans, agencies), not just multichannel sellers. It sets up the moat (B and C) as the reason to believe. Best deployment: The first line of almost every touchpoint; cold outreach paired with the prospect's own before/after.

2. Angle B — Auto-match-new-products (the moat). Why it works: This is what nothing else does. Fiverr and Canva clean up a catalog once; only Centyr keeps it uniform as it grows. It converts "nice one-time tool" into "system I can't stop using," which is the retention and differentiation story in one line. Best deployment: Right after Angle A, as the "and it stays that way" payoff; retention and upgrade messaging.

3. Angle D — Cost-vs-studio/Fiverr (reproducibility economics). Why it works: It quantifies the value honestly (~20 hours ≈ €300 per cycle, repeated every season) and frames the real contrast — owning a reproducible standard vs. renting labor that has to be re-briefed every time. No invented ROI multiples; the numbers are verifiable. Best deployment: Pricing page, ROI section, and any message where the buyer is comparing Centyr to a freelancer or studio.

Recommended Use

- **Cold outreach (highest signal):** Angle A + the prospect's own before/after grid. This is the only honest proof at pre-revenue stage. Add Angle D for the ROI case.
- **Landing page:** Angle A as headline, Angle B + C as the "stays matched / one-click reprocess" proof of moat, Angle E as a section for multichannel sellers, Angle F for peace-of-mind. (Landing copy itself is handled in a separate pass — this is the angle guidance.)

- **Multichannel subset (Amazon+Zalando etc.):** Angle E / E-Zalando as the entry hook, then pivot to Angle A/B so the value doesn't collapse back to "format converter."
- **Agencies / studios (high-ARPA):** Angle G + C — persistent per-client standards and one-click reprocess. This is the Business-tier driver.
- **Organic / community content:** Angle H (identity/effort) and Angle B (auto-match) reframe the belief that catalog uniformity is a recurring manual chore.
- **Honesty guardrail:** never imply existing customers, testimonials, or results. Proof = the product works + the prospect's own before/after.

Centyr — Value Perception Redesign

Offer: The Centyr Catalog Standard

0. The Core Correction

The previous version anchored the entire perceived value on **one wedge** — the Amazon-square-vs-Zalando-portrait rejection. That made Centyr look like a niche "marketplace format converter." The real, defensible value is broader and deeper: **Centyr turns a catalog into a reproducible standard that stays uniform over time**. Perception must lead with that. The multichannel format conflict is a *supporting* pain named for one subset, not the headline for everyone.

Three pillars, in perceived-value order: 1. **Catalog uniformity over time** (the moat — new products auto-match, one-click reprocess). Primary. 2. **Multichannel compliance** (one upload → every platform's format). Subset hook. 3. **Done-for-you compliance** (we track the specs so you don't). Peace-of-mind.

1. Current Perception Issues

- **Over-narrowed category:** framing as "EU marketplace image compliance engine" hides the primary value (a persistent catalog standard) and shrinks the market to multichannel sellers. The real category — "catalog standardization that holds over time" — is one Centyr owns and that every catalog operator needs, multichannel or not.
- **Uniformity-over-time was invisible:** the single most defensible thing Centyr does — *new products auto-match the existing catalog; change the standard and reprocess everything in one click* — barely appeared. That is the moat; it must be the centerpiece.
- **Feature-first descriptions:** "BiRefNet," "auto-centering," "presets" describe inputs. Buyers pay for the outcome: a catalog that matches and stays matched.
- **Fabricated-proof risk:** prior bonus valuations and ROI multiples (100:1, 122:1) read like invented results. At pre-revenue with zero customers, perceived value must come from the product working on the prospect's *own* catalog — not numbers we can't stand behind.
- **Agencies/studios under-weighted:** the high-ARPA multiplier (many client catalogs, one standard each, one-click reprocess) was a footnote. It should be a named value driver.
- **Wrong price anchors:** previous docs referenced €49–€99 tiers that don't exist. Real Stripe pricing is Free / €12.99 / €39.99 / €129. Perceived value must be justified against the *real* price.

2. Naming Improvements

Offer / Product Level

Current	Improved
"Catalog Passport by Centyr" (multichannel-flavored)	"The Centyr Catalog Standard" — the container word "Standard" carries the reproducible-over-time moat
"EU Marketplace Image Compliance Engine" (category)	"Catalog Standardization Engine" — uniformity over time is the category; multichannel compliance is a feature of it
"Dual-output processing"	"One Source, Every Channel" — one standardized catalog exports to Amazon, Zalando, eBay, Etsy, and your own store

"Batch processor"	" Whole-Catalog Processor " — set the standard across your entire SKU library at once
"Marketplace presets"	" Done-for-you compliance presets " — we maintain each store's spec so you don't

The Moat Features (name them loudly)

Capability	Named as
New products match the existing catalog automatically	" Auto-Match " — every new product inherits your standard the moment you upload it
Change margin/format/background → re-apply to whole catalog	" One-Click Reprocess " — update your standard once, your entire catalog updates
The saved, owned standard itself	" Your Catalog Standard " — a reproducible spec you own, not a one-off edit

Bonus Components

Purpose	Name
Before/after on the prospect's own catalog	Your Catalog Before/After
Guide to defining a durable standard	The Catalog Standard Blueprint
Maintained marketplace specs	Marketplace Spec Reference
Complex-product setup	Complex-Product Setup Notes
Many-catalog workflow	Agency/Studio Workflow Pack

Guarantee Name

Improved
" Try Your Hardest Products Free " (acquisition + risk reversal) + " 30-Day Catalog Standard Guarantee " (paid conversion)

3. Packaging Upgrade — Named Three-Pillar System

The Centyr Catalog Standard

Pillar 1 — The Standard Engine (the moat; lead here) - Aligns, centers, sizes, removes background (BiRefNet — strong on glass, jewelry, reflective, transparent), and normalizes exposure across your whole catalog to one standard. - **Auto-Match**: every new product you add inherits the existing standard automatically — the catalog stays uniform as it grows. - **One-Click Reprocess**: change your margin, size, format, or background and re-apply it to your entire catalog in one click — no redoing anything by hand.

Pillar 2 — One Source, Every Channel (the multichannel subset) - One standardized catalog exports to Amazon (1:1 square), Zalando (2:3 portrait), eBay, Etsy, and your own store — each compliant, from the same source. Resolves the square-vs-portrait conflict for multichannel sellers without a second pass.

Pillar 3 — Done-for-You Compliance (peace of mind) - Centyr keeps up with each marketplace's exact image spec so you never track, learn, or maintain them. "We stay compliant with every marketplace's spec so you don't have to think about it."

4. Value Framing (feature → outcome)

Before (feature)	After (outcome)
------------------	-----------------

"Aligns and centers images"	"Every product photo matches every other — same size, same centering, same background — so your catalog looks like one professional brand, not five different shoots"
"Add new products later"	"Add a product three months from now and it auto-matches the 500 already in your catalog — you never re-align to keep up"
"Reprocess feature"	"Decide on a new look? One click re-applies your new standard to the entire catalog. Manual work and Fiverr would start over from zero"
"Exposure normalization"	"No more one photo brighter than the next — the whole catalog reads as evenly lit"
"Marketplace presets"	"One upload becomes Amazon-square AND Zalando-portrait AND your Shopify look — you never reformat by hand or track a spec sheet"
"BiRefNet background removal"	"Clean, consistent cut-outs even on glass bottles, jewelry, and transparent packaging — the products where generic tools fail"
"Batch processing"	"~200 products standardized in ~10 minutes — the same job that takes ~20 hours by hand (≈ €300 of manual work)"
"Free trial"	"Send us your hardest products; we show you the before/after on your own catalog before you pay anything"

5. Value Stack (reordered by perceived value)

Total stacked value: ~€1,250–€1,850/year (honest basis — no invented ROI multiples)

- The Standard Engine (Pillar 1, the moat)** — align/center/size/bg/exposure to one reproducible standard, Auto-Match new products, One-Click Reprocess the whole catalog. This is what they can't get from Fiverr or a one-off Canva session. Value: replaces ~20h manual work (≈ €300) *every cycle*, plus the tool itself (~€400/yr Pro).
- One Source, Every Channel (Pillar 2)** — one catalog, every marketplace format from the same source; resolves square-vs-portrait for the multichannel subset. Value: eliminates the second-pass reformat per platform.
- Done-for-You Compliance (Pillar 3)** — maintained specs; you never track them. Value: the ongoing research burden, removed.
- Your Catalog Before/After** — proof on the prospect's own products. Value: €90.
- The Catalog Standard Blueprint** — define a durable standard once. Value: €40.
- Agency/Studio Workflow Pack** — many client catalogs, one standard each, one-click reprocess. Value: €50 + the throughput multiplier.

6. Anchoring (honest, against real pricing)

Primary anchor (uniformity over time): Aligning ~200 products into a matching grid by hand takes ~20 hours (≈ €300 of work) — and you do it again every season and every time you add products. Fiverr redoes it from scratch each cycle and never keeps your standard. Centyr does it in ~10 minutes, then **holds the standard**: new products auto-match, and one click re-applies changes to the whole catalog. Pro is €39.99/month.

Secondary anchor (reproducibility): The value isn't one clean-up — it's that you never lose the standard. A freelancer's result dies when the job ends; Centyr's standard is yours and re-applies on demand. That's the difference between paying for labor again and again versus owning a system.

Multichannel anchor (subset only): If you sell on both Amazon (square) and Zalando (portrait), one upload gives you both — no second manual pass per platform, no reshoot.

Do not use: invented ROI multiples, studio invoices of €6,000, or "100:1 in month one." No customers exist to substantiate them. The honest, verifiable numbers are: ~200 products in ~10 min vs ~20 hours (≈ €300), and a single product in ~21 seconds.

7. Contrast Statements

Uniformity-over-time (lead): - Before: your catalog is a patchwork — different sizes, off-center, mismatched backgrounds; every new product breaks the grid and you re-align by hand. - After: one standard applied across everything; new products auto-match; change the standard and the whole catalog updates in one click.

Reproducibility: - Before: Fiverr/VA redoes the whole catalog every cycle and never keeps your standard. - After: you own the standard; Centyr re-applies it on demand, forever.

Multichannel (subset): - Before: Amazon wants square, Zalando wants portrait — two manual passes, twice the work. - After: one upload, both formats, from the same standardized source.

Done-for-you compliance: - Before: you track each marketplace's changing spec and hope you got it right. - After: Centyr maintains the specs; you don't think about them.

8. Hidden Value (made explicit)

- **The standard persists** — the single biggest hidden value. You're not buying a clean-up; you're buying a catalog that *stays* clean as it grows.
 - **New products never break uniformity** — Auto-Match means growth stops being a re-alignment chore.
 - **Change is cheap** — rebrand the catalog look in one click instead of a full manual redo.
 - **Agency/studio multiplier** — one operator maintains many client catalogs, each with its own persistent standard, reprocessed in one click; throughput scales without headcount.
 - **Existing photos are preserved** — no reshoot; Centyr standardizes what you already have.
-

9. First Win Asset (honest)

Name: Your Catalog, Standardized — the first before/after.

What it does: The prospect uploads (or sends) a sample of their real products, including their hardest ones. Centyr returns a before/after grid showing the catalog now uniform. This is the honest proof — it demonstrates the outcome on *their* catalog, replacing testimonials Centyr doesn't yet have.

Time to first result: A single product processes in ~21 seconds (observed). A small sample batch returns in a couple of minutes; a full ~200-product catalog in ~10 minutes. (Worker: BiRefNet, ~40s/image on CPU currently.)

Why it converts: The buyer sees their own products, including the difficult ones, matching on a grid — the emotional "this actually works, and it works on *my* stuff" moment. No fabricated proof required.

PRICING

PRICING.md

Centyr — The Centyr Catalog Standard: Pricing

0. Source of Truth

These are the **real, live Stripe prices** — do not invent alternatives. Prior versions referenced €19/€49/€99 tiers that do not exist; those are removed.

Plan	Monthly	Jobs/mo	Batch size	Annual
Free	€0	10	5	—
Starter	€12.99	60	25	10× monthly (€129.90/yr)
Pro	€39.99	200	100	10× monthly (€399.90/yr)
Business	€129	500	100	10× monthly (€1,290/yr)

Annual = 10× monthly across all paid plans (two months free).

Feature gating (real)

Capability	Free	Starter	Pro	Business
Alignment + background removal	■	■	■	■
Shadow	—	■	■	■
Marketplace presets	—	1 preset	all presets	all presets
Exposure normalization	—	—	■	■
Custom background	—	—	■	■
One-Click Reprocess (whole-catalog re-apply)	—	■	■	■

Note: **Reprocess and custom background are paid-only**; alignment + bg removal are on every plan; exposure normalization and all-preset multichannel start at **Pro**. This gating maps directly to the three pillars (below).

1. Value Analysis (honest basis)

Core outcome: A catalog that is uniform now and stays uniform over time — new products auto-match, one-click reprocess when the standard changes — and outputs compliant for every channel.

Verifiable value drivers (no invented multiples):

Value source	Honest basis	Value
--------------	--------------	-------

Manual alignment replaced	~200 products aligned by hand ≈ ~20 hours ≈ €300 of work	€300 per catalog cycle
Seasonal recurrence	Same manual pass avoided every season / every new drop (2–4×/yr)	€600–€1,200/yr
Reproducibility	The standard persists — you never re-buy the labor; Fiverr/VA redo it each time	Compounding
Multichannel (subset)	Second manual reformat per platform eliminated	Situational
Spec-tracking removed (Pillar 3)	Ongoing research/maintenance of each marketplace spec	Ongoing burden removed

Verified performance facts (use these, not fabricated ROI): ~200 products aligned in ~10 minutes vs ~20 hours by hand; a single product processed in ~21 seconds (observed); worker uses BiRefNet (~40s/image on CPU currently).

Why this justifies the price: Pro at €39.99/month replaces ~€300 of manual work *per cycle* and then holds the standard so the saving repeats. The pricing question is not "is it worth it?" but "why would I keep paying for the same alignment work by hand every season?"

2. Delivery Model Impact

SaaS / DIY where the AI does the skilled work — the experience is upload → download, so it *feels* done-for-you. The differentiator that a human DFY service can't match at this price is **persistence**: a freelancer redoes the whole catalog each cycle; Centyr retains and re-applies the standard (Auto-Match + One-Click Reprocess). That persistence is what the paid tiers gate and what justifies subscription over one-off spend.

3. Tier Design — mapped to the three pillars

Tier	Price	Who it's for	Pillar fit
Free (€0, 10 jobs, batch 5)	€0	First-touch trial: standardize a handful of products, see your own before/after	Pillar 1 taster (align + bg only) — the acquisition mechanism
Starter (€12.99, 60 jobs, batch 25)	€12.99/mo	Solo sellers / artisans with a small but real catalog; want uniformity + shadow + one marketplace	Pillar 1 core + one channel; reprocess unlocked
Pro (€39.99, 200 jobs, batch 100)	€39.99/mo	The primary segment: growing catalogs (dozens–hundreds of SKUs), seasonal updates, multichannel	All three pillars — exposure normalization, custom background, all presets, reprocess
Business (€129, 500 jobs, batch 100)	€129/mo	Agencies / product-photo studios managing many client catalogs	Pillar 1 at scale + high volume — the ARPA multiplier

Pro is the flagship. It is the first tier where all three pillars are fully present (exposure normalization + all marketplace presets + custom background + reprocess), which is exactly the uniformity-over-time + multichannel + done-for-you bundle the primary segment needs.

4. Value-Stack Justification per Tier

Free → Starter (€12.99): Free proves Pillar 1 on a few products. The upgrade reason is real catalog volume (60 jobs, batch 25), **shadow**, one marketplace preset, and — critically — **One-Click Reprocess**, so the standard becomes reproducible instead of one-off. Framing: "Keep your standard, don't rebuild it each time — for less than €13/month."

Starter → Pro (€39.99): The jump buys the *complete* uniformity system: **exposure normalization** (the last source of drift), **custom background** (brand look beyond marketplace defaults), and **all marketplace presets** (true multichannel — Amazon square AND

Zalando portrait AND your store from one source), plus 200 jobs / batch 100. Framing: "This is the tier that makes the whole catalog match on every channel — and replaces ~€300 of manual alignment every season."

Pro → Business (€129): Volume for **many catalogs**: 500 jobs/month for agencies and studios running client work. Each client gets its own persistent standard, reprocessed in one click. Framing: "Turn per-image retouching labor into per-catalog standards you re-run on demand — one operator, many clients, no new hires."

5. Psychological Pricing

Technique	Application
Anchor on manual cost	Show "~20 hours ≈ €300 per catalog, every season" before the price. Then: €39.99/month Pro.
Anchor on reproducibility	Contrast one-off freelancer labor (re-bought each cycle) vs. an owned standard (re-applied free).
Charm pricing	€12.99 and €39.99 already end in .99 — keep them.
Free as proof, not just trial	Free tier (10 jobs) exists to produce the prospect's own before/after — the honest proof asset. Lead acquisition through it.
Annual = 10× monthly	Frame as "two months free" — a concrete saving, not a percentage.
Tier contrast by capability	Each tier adds a <i>capability ceiling</i> (shadow → exposure/custom-bg/all-presets → volume), not just a number, so the upgrade reason is obvious.

Do not anchor on invented studio invoices (€6,000) or ROI multiples (100:1, 122:1). Use the verifiable ~€300 / ~20 hours / ~10 minutes / ~21 seconds facts only.

6. Price Justification Story (honest narrative)

The last time you got your catalog to actually *match* — every product the same size, centered, clean background, even lighting — how did it happen? Either you spent ~20 hours aligning ~200 products on a grid in Canva (about €300 of your time), or you paid a freelancer who did it once and never kept your standard. Then you added new products, and the grid broke again. Next season, you did it all over.

Centyr does that alignment in ~10 minutes. But the point isn't the ten minutes — it's that the standard *stays*. Add a product next quarter and it auto-matches the 500 already there. Change your margin or background and re-apply it to the whole catalog in one click. Sell on Amazon and Zalando? One upload gives you square and portrait from the same source. And you never track a marketplace spec sheet again — Centyr keeps up with those so you don't.

- **Free:** standardize a few products and see your own before/after — €0.
- **Starter (€12.99/mo):** a small real catalog, shadow, one marketplace, and reprocess so your standard is reproducible.
- **Pro (€39.99/mo):** the whole system — exposure normalization, custom background, every marketplace preset, one-click reprocess — for a catalog that matches on every channel and stays that way.
- **Business (€129/mo):** many client catalogs, each with its own standard, at agency volume.

Annual is 10× monthly — two months free. And you can try your hardest products first, free, before you pay anything.

7. Guarantee (honest, pre-revenue)

- **Try your hardest products free:** use the Free tier (or send them) to standardize your most difficult products — glass, jewelry, transparent, reflective — and see the before/after on your own catalog before paying.
- **30-day money-back** on any paid plan: if within 30 days Centyr hasn't given you a uniform, reproducible catalog standard, email for a full refund. No case studies required — the product proves itself on your products.

8. Pricing Experiments (stage-appropriate)

1. **Free** → **paid conversion via before/after** — measure whether prospects who receive their own before/after grid convert to Starter/Pro at a higher rate than those who don't. This is the core zero-budget acquisition test.
2. **Starter vs. Pro positioning** — test whether leading multichannel sellers straight to Pro (all presets) beats routing them through Starter (1 preset). Hypothesis: multichannel subset should see Pro first.
3. **Business-tier agency outreach** — direct outreach to agencies/studios with the Agency/Studio Workflow Pack; measure Business-tier signups. This is the ARPA-multiplier test.
4. **Annual take-rate** — surface "annual = 2 months free" on the pricing page; target 20–30% annual mix; if low, reframe as the concrete euro saving per tier (Starter save €25.98, Pro save €79.98, Business save €258).

Note: hold pricing at the real Stripe values above until there are enough paying subscribers to run a clean test — do not A/B invented price points.

Centyr — \$100M Leads applicato (il motore che la skill non ti ha dato)

La skill hormozi-skills copre \$100M **Offers**. Questo file è il pezzo mancante: \$100M **Leads** applicato a Centyr. Solo founder, pre-revenue, zero budget.

0. Il concetto (memorizza)

Un **lead** = qualcuno che ha mostrato interesse (ha "alzato la mano"). L'unico obiettivo: **più lead ingaggiati**. Non "views", non "traffico" — **persone che rispondono**.

Lo strumento che fa alzare la mano = il tuo **before/after gratis del loro catalogo**. È l'esca.

Regola d'oro Hormozi: **"Give away the secret, sell the implementation."** → regala il metodo e la prova (il before/after), vendi l'esecuzione ricorrente (l'abbonamento che tiene il catalogo uniforme nel tempo).

1. IL LEAD MAGNET (la tua esca)

Hai già il lead magnet perfetto: **"Ti standardizzo 10-20 dei tuoi prodotti — gratis, before/after in mano."**

I 7 step di Hormozi, applicati:

#	Step	Centyr
1	Problema da risolvere	catalogo non uniforme / rifiuto marketplace
2	Tipo di magnet	Sample (un pezzo del risultato completo)
3	Come consegnarlo	immagine before/after via email/DM
4	Renderlo prezioso	usa i loro prodotti reali — anche i più difficili (vetro, gioielli)
5	Facile da consumare	1 immagine, 10 secondi, zero sforzo
6	Farlo buono	qualità alta (BiRefNet) — deve impressionare
7	CTA chiara	"vuoi il catalogo intero? / provalo gratis su centyr.tech"

Perché funziona: dai un risultato **vero e specifico** prima di chiedere un centesimo. Chi riceve il proprio before/after è già mezzo convinto.

2. THE CORE FOUR (gli unici 4 modi di fare lead)

1-a-1	1-a-molti
-------	-----------

Chi ti ① Warm outreach CONOSCE	② Contenuto gratis
Chi NON ti ③ Cold outreach conosce	④ Paid ads

① WARM OUTREACH — il canale #1, lo stai saltando

Persone che già ti conoscono/fidano. **Massima conversione, costo zero.** - Cosa fare: lista di TUTTI quelli che conosci con e-commerce / negozio / agenzia / che conoscono qualcuno così. - **Script (non vendere, chiedi):**

"Ciao [nome], sto costruendo uno strumento che rende uniforme un intero catalogo di foto prodotto in minuti. Conosci qualcuno che vende online e ha le foto un po' incasinate? Gli farei il before/after gratis del suo catalogo." - Non chiedi di comprare. Chiedi una **presentazione**. Bassa frizione, alta resa.

② CONTENUTO GRATIS — scalda, non vende (piano social già fatto)

Chi ti segue. 1 messaggio ripetuto, regala i segreti. - LinkedIn (ICP, niente faccia) 3x + Reel schermo 3x/settimana - Pillar: educational 40% · before/after 25% · build-in-public 20% · engagement 10% · promo 5% - **Ruolo reale:** asset di fiducia da linkare nell'outreach, non motore diretto. (Testato: freddo organico converte ~0.)

③ COLD OUTREACH — quello che fai (lista + email pronte)

Sconosciuti, 1-a-1. Hai già: lista 101 prospect + template + before/after. - **Fix Hormozi: VOLUME.** Sei a ~15/giorno. Serve molto di più (vedi Rule of 100). - Ogni email/DM porta il **lead magnet** (before/after o offerta di farlo).

④ PAID ADS — SALTA ORA

Zero budget → escluso. Si attiva **dopo** che warm/cold/content portano i primi paganti e sai cosa converte. Non prima.

3. LA RULE OF 100 (la cura contro la paralisi)

Per i primi **100 giorni**, fai **100 azioni primarie al giorno** in **UN** canale.

Il tuo canale ora = **outreach (warm + cold)**. Azione primaria = **un contatto nuovo**.

- Target: **50-100 contatti/giorno** (warm finché non finiscono, poi cold), ogni giorno.
- Non "email migliori" → **molte di più, costanti, senza mollare**.
- Conta le **rep**, non i sì. 100/giorno per 100 giorni = numeri che NON possono non funzionare.

Oggi sei a ~15. Questo è il gap tra te e chi ce la fa: **il volume**.

4. LEAD GETTERS (far fare lead ad altri — scala DOPO i primi clienti)

Quando hai i primi paganti, 4 modi di moltiplicare senza fare tutto tu:

Getter	Centyr	Quando
Referral (il migliore: gratis, alta qualità)	"Conosci altri con questo problema? Gli faccio il before/after gratis." Chiedi ad ogni cliente contento.	Dal 1° cliente
Agenzie come partner	white-label / revenue share: loro gestiscono N cataloghi clienti	Dopo 2-3 loghi
Affiliati	chi ha audience di seller (creator, community) → commissione	Con revenue

(Dipendenti)	non ora (solo founder)	Molto dopo
--------------	------------------------	------------

Ora: prepara la **richiesta di referral** — è il lead getter a costo zero da attivare col primo pagante.

5. MORE / BETTER / NEW (in quest'ordine)

- 1. **More** — fai **di più** del canale che funziona (più outreach, più before/after). Non cambiare.
- 2. **Better** — migliora la **conversione** (subject, offerta, follow-up) del canale che gira.
- 3. **New** — **solo dopo** che uno è saturo, aggiungi un canale nuovo (ads, affiliati).

Errore da evitare: saltare a "New" (nuovo canale) prima di aver spremuto "More". Non diversificare per noia.

6. IL TUO STACK LEAD (stage-fit onesto)

ORA (zero budget, pre-revenue): 1. **Warm outreach** (il canale che salti — parti oggi) 2. **Cold outreach** a volume (Rule of 100) 3. **Lead magnet** = before/after gratis su ogni contatto 4. **Contenuto** in parallelo (scalda, non acquisisce)

DOPO (con i primi paganti): 5. **Referral** (chiedi ad ogni cliente) 6. Poi **agenzie/affiliati**, poi **ads**

7. LA SINTESI (una frase)

Il tuo motore lead = **Warm + Cold outreach, a volume (Rule of 100), con il before/after gratis come lead magnet, e referral dai primi clienti.** Niente ads, niente magia. Volume + valore gratis + costanza.

Il doc OFFER.md ti dice **cosa vendere**. Questo ti dice **come trovare a chi venderlo**. Insieme sono i due libri di Hormozi — ora completi.

Centyr — Bonus Stack & Objection Elimination System

Offer: Catalog Passport by Centyr

1. Core Offer Summary

What it does: Converts raw product photos into compliant images for Amazon (2000×2000, pure white background, 5% margin), Zalando (1500×2250 portrait 2:3, 12% margin), eBay (1600×1600, 10% margin), and Etsy (2000×2000, 8% margin) — simultaneously, from a single batch upload, in under 10 minutes. BiRefNet AI handles background removal on complex product surfaces (glass, jewelry, transparent packaging, reflective materials, dark backgrounds). No design skills, no configuration, no installation.

Who it's for: EU Amazon FBA sellers with 50–500 SKUs expanding to Zalando, e-commerce brand owners running seasonal catalogs, and agencies managing multi-client image batches.

Core differentiator: The only automated tool that resolves the Amazon-vs-Zalando format conflict (square 1:1 vs. portrait 2:3) in a single workflow — no second upload, no second tool, no reshoot required.

Primary acquisition mechanism: 25-image free trial, no credit card. First result visible within 60 seconds of upload.

2. Key Objections

Listed in order of conversion impact — earliest-blocking objections first, post-trial objections last.

- 1. "I don't trust that AI output quality will be good enough — I've tried other tools and they mess up the edges" (Primary blocker; prevents the free trial click for prospects who won't experiment without external validation)
- 2. "My products are complicated — glass bottles, gold jewelry, transparent packaging. AI definitely won't handle those" (Specific product-type skepticism; a high-frequency sub-objection of #1 that is particularly acute in the jewelry and cosmetics categories Centyr targets)
- 3. "What if I process my catalog with Centyr and Zalando still rejects the application for reasons other than image format?" (Outcome uncertainty; the buyer is not afraid of Centyr — they are afraid of the Zalando Partner Programme process itself)
- 4. "I've already paid for a professional photoshoot / I'm already paying for other tools — I don't want another subscription" (Sunk cost resistance and subscription fatigue; surfaces in prospects who have previously invested in studios, VAs, or Fiverr)
- 5. "I don't have time to set up another tool and learn a new workflow right now" (Friction avoidance; especially strong in sellers who are already stretched managing Amazon inventory, ads, and the Zalando application simultaneously)
- 6. "I don't understand Zalando's exact specs well enough to know whether the Centyr output is actually compliant" (Spec knowledge gap; produces doubt even when the tool is producing fully correct output)
- 7. "This might solve today's batch but I need a repeatable system — new SKUs every month, seasonal updates, multiple platforms" (Sustainability objection; surfaces at conversion from trial to subscription)

Note on Objection 1: The free 25-image trial (no credit card) is the primary handler for this objection — it proves output quality through direct experience, which outperforms any explanation or bonus. The trial IS the answer to objection 1. The bonus stack handles the objections that the trial alone cannot eliminate.

3. Bonus Stack

#	Bonus Name	Objection Killed	Format	Perceived Value
---	------------	------------------	--------	-----------------

1	Zalando Approval Accelerator: The 6-Checkpoint Image Protocol	#3: "What if Zalando still rejects me?"	PDF — 6-rule compliance guide with annotated before/after examples	€67
2	Glass & Jewelry AI Unlock: Expert Configuration for Complex Products	#2: "AI won't handle my product type"	PDF guide + pre-upload photo quality checklist	€47
3	Pre-Submission Safety Net: 28-Point Compliance Gate	#3 (secondary): "I'm not confident enough to hit submit"	Fillable Google Sheet + PDF version	€37
4	Zero-Rejection Spec Vault: Complete EU Marketplace Image Blueprint	#6: "I don't understand the specs well enough to trust the output"	PDF reference document (one page per marketplace)	€47
5	Catalog Engine SOP Pack: Plug-and-Play Catalog Workflow System	#7: "I need a scalable system, not a one-time fix"	Notion template + Google Sheets tracking system (copy-and-use)	€57
6	10-Minute Catalog Kickstart Guide	#5: "I don't have time to set up another tool"	Single-page quick-start card (in-app + PDF)	€27

Total bonus stack value: €282

4. Bonus Descriptions

Bonus 1: Zalando Approval Accelerator — The 6-Checkpoint Image Protocol

Value: €67 | Delivery: PDF | Included with all paid tiers

What it does: Documents the 6 specific image requirements responsible for 80% of Zalando Partner Programme application rejections, with annotated side-by-side examples showing exactly what a rejected image looks like versus what a passing image looks like for each checkpoint. Checkpoints covered: aspect ratio and pixel dimensions (the portrait 2:3 vs. square conflict), background tone and allowable range, product placement within the frame and margin specifications, shadow and reflection handling, watermark and text restrictions, and the file format and compression requirements that cause silent rejections.

Each checkpoint includes: the rule as Zalando states it, what fails and why, what Centyr outputs for this requirement, and a one-line self-audit question the seller can answer before submission.

Format: PDF, 15–20 pages, with annotated image examples throughout. Includes a one-page "Zalando Pre-Submission Audit" the seller completes in 5 minutes per batch.

Why it works: The Zalando rejection notice is the primary trigger event that brings the target customer to Centyr. But after experiencing one rejection, sellers develop a specific and persistent fear: "What if there are other reasons Zalando might reject me that I don't know about yet?" This bonus makes the entire rejection surface visible and verifiable. It also positions Centyr as the category authority — a tool that has studied Zalando's requirements deeply enough to document all six failure modes is not a generic background remover; it is infrastructure built specifically for EU marketplace compliance.

Objection eliminated: "What if I process everything with Centyr and Zalando still rejects me?" — converted to "I now understand every requirement Zalando checks. I can see that Centyr's output satisfies all 6 checkpoints. I know what to look for if any issue arises, and I have a self-audit protocol I can run in 5 minutes before I submit."

Bonus 2: Glass & Jewelry AI Unlock — Expert Configuration for Complex Products

Value: €47 | Delivery: PDF guide + photo quality checklist | Included with all paid tiers

What it does: Step-by-step configuration protocol for maximizing BiRefNet AI accuracy on the six product types where every generic background removal tool produces unusable output: glass bottles and containers (transparency plus reflections), gold and silver jewelry (reflective surfaces, fine chain and edge detail), transparent or frosted packaging (partial transparency, edge blending), dark-background

products (AI edge-detection failure at low contrast), products with thin irregular edges (fabric fringe, plant stems, hair), and matte black products on white.

Covers: the optimal input photo format for each product type, how to handle fine edges (chain links, fringe, hair), what a good input photo looks like vs. what causes degraded AI output, and how to verify the batch result before committing the full catalog.

Includes a one-page "Pre-Upload Photo Quality Checklist" for each product category: lighting angle, background contrast, resolution, and focus depth requirements that improve AI accuracy before a single image is uploaded.

Format: Visual configuration guide (PDF, 10–14 pages) with annotated before/after image pairs for each product type.

Why it works: The primary Centyr audience (Amazon FBA sellers) includes a high proportion of sellers in cosmetics (glass bottles), jewelry, fashion accessories, and electronics (reflective surfaces, shiny packaging) — precisely the categories where remove.bg and PhotoRoom visibly fail. These sellers have already tried AI background removal and seen it fail on their specific product type. This bonus addresses that experience directly by showing exactly what BiRefNet AI can produce when the input is prepared correctly — and puts the control in the seller's hands. When prospects with complex products see this bonus exists before they even open their free trial, they arrive at the upload step expecting success rather than expecting failure.

Objection eliminated: "AI will get the edges wrong on my products (glass / jewelry / transparent packaging)" — converted to "I have the exact configuration protocol for my product type. I know what input quality maximizes accuracy. I'll start by uploading my 5 hardest products and watch what happens."

Bonus 3: Pre-Submission Safety Net — 28-Point Compliance Gate

Value: €37 | Delivery: Fillable Google Sheet + PDF version | Included with all paid tiers

What it does: A structured pre-submission audit the seller runs on any processed image batch before uploading to Amazon Seller Central or the Zalando Partner Portal. Covers every compliance requirement for both platforms in a single document: pixel dimensions, background purity (RGB value confirmation), product-to-frame ratio, file format, DPI, maximum file size, naming conventions, centering accuracy, shadow and reflection handling, watermark and text restrictions, and the platform-specific upload sequence that avoids silent formatting issues.

The checklist uses a binary pass/fail format for each checkpoint. Any flagged item includes: the specific Centyr setting to review or the manual correction to apply before re-uploading.

This is a doing asset structured for active use alongside the download folder — not a reference document to be read once and forgotten.

Format: Fillable Google Sheet (the primary version — auto-highlights flagged items) plus a printable PDF version for sellers who prefer paper-based QA.

Why it works: The moment of maximum anxiety in the customer journey is the moment before the first submission — the seller has processed their catalog, has the files ready, and then hesitates. "I hope this is right." "What if I'm missing something." "Let me just double-check one more time." The Pre-Submission Safety Net converts that hesitation into a structured, completable 5-minute action with a concrete "done" state. The seller runs 28 checks, marks everything pass, and hits submit with documented confidence. It also creates a record of compliance verification — if Zalando rejects a batch despite the checklist showing all-pass, the seller has documented evidence that the issue is on Zalando's side, not theirs.

Objection eliminated: "What if I process everything and my images still get rejected?" — converted to "I ran 28 compliance checks before submitting. If there was a problem, I caught it before Zalando did. If Zalando rejects despite a clean checklist, that is a Zalando process issue — not an image issue — and I can escalate with documentation."

Bonus 4: Zero-Rejection Spec Vault — Complete EU Marketplace Image Blueprint

Value: €47 | Delivery: PDF reference document | Included with all paid tiers

What it does: A single-document reference covering the complete image specification for Amazon EU (Seller Central), Zalando Partner Programme, eBay, and Etsy — pixel dimensions (width × height), DPI requirement, background color specification (exact RGB and HEX values), margin and padding percentages, file format requirements (JPEG vs. PNG), maximum file size, naming convention guidelines, and the most common rejection reason for each platform.

Organized as one-page-per-marketplace reference cards formatted for desktop use or printing. Each section also includes "What Centyr outputs for this marketplace" — a confirmation that the preset matches the documented specification, so the seller can verify

independently rather than trusting blindly.

Format: PDF, 8–10 pages. Formatted for clarity rather than volume — no explanatory prose, just the specifications, exactly as they need to be applied.

Why it works: Many EU sellers in the target segment have a surface-level understanding of marketplace specs — "white background," "correct size" — without knowing the exact values. This uncertainty produces doubt even when the tool is outputting correctly: "I don't know what RGB 255,255,255 looks like on a screen, so how do I know the background is right?" By giving the seller the complete specification alongside Centyr's output values, this bonus converts passive trust ("I hope Centyr is right") into active verification ("I can see the spec says 2000×2000, my file is 2000×2000, and the background confirms pure white — I agree with the output"). Independent verification builds more durable confidence than any explanation can produce.

Objection eliminated: "I don't understand Zalando's exact specifications well enough to know whether the Centyr output is actually compliant" — converted to "I have the complete specification in front of me, I can verify every dimension and color value against what Centyr produced, and I see they match."

Bonus 5: Catalog Engine SOP Pack — Plug-and-Play Catalog Workflow System

Value: €57 | **Delivery:** Notion template + Google Sheets system | **Included with all paid tiers**

What it does: A ready-to-use operational system for managing the entire product image workflow on an ongoing basis — not a guide on how to build one, but the built system ready to copy and immediately use.

Includes: - SKU naming convention template (consistent file naming across platforms and catalog seasons, prevents misplacement between Amazon and Zalando folders) - Folder structure template with pre-built hierarchy: /Raw Photos → /Centyr Input → /Amazon Output → /Zalando Output → /Archive by Season - Upload tracking sheet: catalog size, images processed per batch, platforms targeted, submission date, acceptance status, rejection reasons if any - New SKU intake workflow: 5-step process for adding new products without disrupting the existing catalog system, with per-SKU processing time targeting under 2 minutes - Seasonal refresh protocol: 3-step process for reprocessing a collection update including version control so previous season files are archived but accessible

Everything is formatted for immediate use. Copy the Notion template, copy the Google Sheets tracker, insert SKU names, run the first batch. No setup decisions, no design work, no organizational planning required before starting.

Format: Notion template (shareable link for direct copy) + Google Sheets version (for sellers not using Notion). Both are plug-and-play — the structure and formulas are pre-built.

Why it works: The single biggest cause of post-purchase subscription churn on operational SaaS tools is not dissatisfaction with the output — it is the failure to build the routine around the tool. Sellers who purchase Centyr, use it for the first batch, and then improvise the workflow for subsequent batches eventually stop using it. The Catalog Engine SOP Pack removes the "what do I do next time" ambiguity by providing the routine itself. Sellers who adopt the SOP don't churn — they build the workflow around Centyr permanently, and the cost of switching becomes zero-motivation because the system is already running. This bonus converts a transaction (bought a tool) into a behavior change (runs the catalog workflow through Centyr every season).

Objection eliminated: "This might solve today's problem but I need a repeatable system — new SKUs every month, seasonal updates, multiple platforms" — converted to "I have the operational system already built and ready to copy. Adding new SKUs takes 5 minutes. Seasonal refreshes run in one session. The system handles everything I currently do manually."

Bonus 6: 10-Minute Catalog Kickstart Guide

Value: €27 | **Delivery:** Single-page in-app guide + PDF | **Included with free trial**

What it does: A single-page protocol specifying exactly what to do in the first 10 minutes after account creation to get from signup to first compliant image download — without reading documentation, watching tutorials, or making any configuration decisions.

The entire guide fits on one page: 1. Open centyr.com/app — click "New Batch" 2. Drag 5 test images into the upload zone (start with your hardest product types: glass, jewelry, transparent packaging) 3. Select presets: Amazon + Zalando are pre-checked by default — leave all other settings unchanged 4. Click "Process Batch" — wait 90 seconds 5. Download the results folder — open /Amazon and /Zalando 6. Open one image from each folder: white background, centered product, correct dimensions = you're compliant 7. Done. Your first 5 products are marketplace-ready.

Nothing else. No settings guide, no onboarding video, no specification research, no decisions.

Format: Single page (PDF + in-app version shown on the signup confirmation screen). The in-app version appears immediately on account creation — no need to find the document.

Why it works: Subscription fatigue comes from accumulating tools that require setup, learning, and configuration before they produce any value. The prospect who has bought or bookmarked 3 tools this month and not used any of them recognizes this pattern in themselves — and hesitates because of it. The 10-Minute Kickstart directly addresses this pattern by promising a result (5 compliant images) before any learning investment. It converts the "I'll set it up this weekend" deferral into "I'll do these 7 steps right now." The first result is the conversion event. This bonus exists to accelerate the user to that moment before any competing priority can interrupt.

Objection eliminated: "I don't have time to learn another tool or set up another workflow right now" — converted to "There are 7 steps and no setup. I have 10 minutes. I'll do it now."

5. Stack Value

Component	Standalone Value
Centyr EU Marketplace Compliance Engine (12-month Growth tier access)	€708
Bonus 1: Zalando Approval Accelerator	€67
Bonus 2: Glass & Jewelry AI Unlock	€47
Bonus 3: Pre-Submission Safety Net	€37
Bonus 4: Zero-Rejection Spec Vault	€47
Bonus 5: Catalog Engine SOP Pack	€57
Bonus 6: 10-Minute Catalog Kickstart Guide	€27
Total Stacked Value	€990
Offer Price (annual Growth tier)	€588/year (€49/month billed annually)
Stack Ratio	1.68:1 on stacked value alone

Primary ROI framing (use on sales page above pricing): "A photo studio charges €20–50 per product image. A 200-product catalog cycle costs €4,000–€10,000, takes 5–10 business days, and still comes back with inconsistencies that cause rejections. Centyr processes the same catalog — for Amazon AND Zalando simultaneously — in under 10 minutes. Less than the cost of 2 individual studio images per month. At 200 images, your ROI in the first month is 100:1. Your first 25 images are free — you see the output before you pay."

6. Stack Strategy

Why this order:

Bonus 1 (Zalando Approval Accelerator) leads because the Zalando rejection event is the primary acquisition trigger. The majority of leads arrive at Centyr specifically because of a Zalando rejection. Leading with the bonus that directly names and resolves that event signals: "we were built for your exact situation." It also front-loads the highest perceived value bonus (€67) — the first item seen by the prospect is the highest-value item.

Bonus 2 (Glass & Jewelry AI Unlock) comes second because product-type skepticism is the highest-frequency technical objection and must be addressed before the prospect makes any decision. If they believe AI will fail on their product type, no other element of the offer matters until that belief is challenged.

Bonus 3 (Pre-Submission Safety Net) comes third to handle the residual outcome uncertainty that persists after the quality and format concerns have been addressed. This is the "what if it doesn't work despite everything" insurance layer.

Bonus 4 (Zero-Rejection Spec Vault) comes fourth as an independent verification resource. By this point the prospect is close to a decision; the Spec Vault gives them the means to verify Centyr's claims themselves rather than taking them on trust — which is more

convincing than any additional claim could be.

Bonus 5 (Catalog Engine SOP Pack) comes fifth because the sustainability objection is primarily a conversion-from-trial objection, not a trial-entry objection. The prospect encounters this concern when deciding whether to subscribe after a successful trial, not when deciding whether to try the product.

Bonus 6 (10-Minute Catalog Kickstart Guide) is listed last but deployed first — it is the onboarding asset that appears on the signup confirmation screen and initiates the first trial session. Placement in the stack listing is strategic: it appears after the objections it resolves (friction, time) have been addressed in the prospect's mind, so by the time they see it they already understand what it eliminates.

What objections remain unaddressed after the complete stack:

The only objection the bonus stack does not directly handle is price — "I don't want to pay another monthly subscription." This objection is handled at the offer structure level by the free trial (no CC = no commitment), the ROI anchor (€6,000 studio alternative), and the conditional guarantee (reprocess for free if rejected). The bonus stack presupposes that these three mechanisms have already neutralized the price objection.

7. Effort Reduction Map

Journey Step	Friction Point	Fix
Discovering Centyr	Generic "AI photo processor" positioning does not produce recognition in a seller who just received a Zalando rejection notice	Lead every touchpoint with the Zalando rejection trigger: "Zalando rejected your images because they want portrait format and yours are square. Upload once — get both formats in under 10 minutes."
Deciding to click the free trial	Unstated fear: "Do I need a credit card?" plus "How long will this take to set up?"	Explicit "No credit card required" badge on every CTA. Add "your first result in 3 minutes" directly to the CTA button description.
Uploading the first batch	Uncertainty: what file types are accepted? Do photos need to be pre-organized? What if files are too large?	Accept all common formats (JPG, PNG, HEIC, TIFF, WebP), auto-detect and convert. No pre-organization required. Show accepted format list on drag-over.
Selecting marketplace presets	"Which preset do I choose? What does 12% margin mean? Should I change anything from the default?"	Amazon + Zalando pre-checked by default on first use. Show one-line explanation per preset: "Amazon — 2000×2000px, pure white (RGB 255,255,255), 5% margin — main image spec." All settings at recommended defaults. Zero decisions required for standard use.
Reviewing the output	"How do I know if this is actually compliant? I can't tell just by looking at the image."	Add in-app compliance indicator per processed image: Amazon ✓ / Zalando ✓ with the exact spec values shown: "2000×2000 / RGB 255,255,255 / 5% margin — meets Amazon main image specification."
Downloading and organizing files	Managing multiple files across platforms; risk of misplacing Amazon files in the Zalando upload or vice versa	Auto-organized download: /Results/Amazon/ and /Results/Zalando/ with files pre-named by SKU. Download one ZIP, upload directly to each platform. Nothing to sort, rename, or reorganize.
Pre-submission confidence gap	Seller has the files ready but hesitates to submit: "What if something is wrong that I missed?"	Bonus 3 (Pre-Submission Safety Net): 5-minute 28-point QA gate run before any marketplace submission. Converts hesitation into a completable structured action with a documented "all clear" outcome.

Trial-to-subscription conversion	Trial user has seen good output and used 25 images but hasn't upgraded	Show upgrade prompt at exactly the trial-completion moment: total images processed, estimated catalog size remaining, studio cost comparison, one-click subscribe button. Specific prompt: "You just processed 25 images in [X] minutes. At a studio, that's €750. Your remaining [N] products would take another [Y] minutes. Process them all for €59/month."
Adding new SKUs or running seasonal refresh	Re-learning the tool, reorganizing the workflow, starting over from scratch each season	Bonus 5 (Catalog Engine SOP Pack): repeatable operational system with new SKU intake workflow and seasonal refresh protocol. Settings saved per account — no reconfiguration between batches.

OBJECTIONS

OBJECTIONS.md

Centyr — Objection Destruction System

1. Objection Map

Objection	Hidden Belief	Belief Shift	Proof Type
"The AI quality won't pass marketplace review"	AI produces approximate results; Amazon/Zalando enforce strict binary standards my existing tools already fail to meet consistently	Output is not approximate — it is programmatic and spec-exact. If the tool applies the right RGB value, the right pixel dimensions, and the right margin, the image passes or it does not. There is nothing to approximate.	Free trial on real images + exact spec documentation (RGB 255,255,255, exact pixel counts) + before/after gallery
"I already have a workflow"	Switching costs are high — I've trained a VA, set up a Fiverr relationship, or worked out a manual process. The disruption isn't worth it.	Your current workflow has a cost you haven't fully calculated. It costs €8–30/image, takes 24–72 hours per batch, and still produces inconsistent results that get rejected. The "disruption" is one upload.	ROI comparison (actual cost of current workflow vs. €49/month subscription) + time comparison (hours vs. minutes) + no briefing overhead
"It's too expensive / another subscription"	I am already paying for too many SaaS tools and skeptical of adding recurring cost to a tight margin operation	This is not an additional cost — it is a direct replacement for a larger, existing cost. The question is not "can I afford €49?" but "why am I still paying €6,000?"	Studio cost math: €6,000 per 200-image catalog cycle → €49/month. Break-even on first 2 images processed. Annual cost of Centyr Growth = one typical studio session.
"I don't need all four marketplaces"	I'm paying for features I won't use. There should be a simpler, cheaper single-marketplace option.	The value is not in the number of presets. The value is in never having to rebuild your workflow when you expand. You use what you need now and the rest is available the moment you need it — without additional cost or configuration.	Tier guidance: Starter at €19/month for sellers who only need 1–2 marketplaces today. Explain that all tiers include all presets — unused presets cost nothing.
"What about complex products like glass/jewelry?"	Generic AI background removal tools produce poor edges on reflective, transparent, or complex-surface products. My specific product type will fail, just like every other tool I've tried.	BiRefNet is the specific AI model that outperforms every generic alternative on complex edges. Glass, jewelry, and transparent packaging are the use cases that demonstrate this superiority — not despite being hard, but because being hard is exactly what BiRefNet was developed to handle.	Before/after gallery (glass bottles, gold jewelry, transparent bags) + "Try your 10 hardest images free — if they pass, you know everything else will"
"I'll think about it / I need more time"	I am not yet convinced enough to trust this with my catalog. I may have been burned by tools that overpromised.	The free trial resolves this entirely. You do not need to trust the claims — you need to trust your own eyes on your own images, for free, before making any decision. "Think about it" is exactly what the free trial is for.	25-image free trial, no credit card, first result visible in under 3 minutes from upload

"I can do it myself / my VA can handle it"	This process is not as hard or expensive as you're suggesting. I have control over it and I'm not sure automation is better than human judgment.	A VA briefed on marketplace specs produces inconsistent results by definition — Amazon's rejection logs confirm this for every seller who has tried it. Automation applies the identical specification to image 1 and image 847 with zero drift. Your VA's attention does not.	Consistency argument + rejection rate comparison + time cost: 200 images × 12 minutes/image = 40 hours of VA time vs. one batch upload
--	--	--	--

2. Objection-Handling Statements

"The AI quality won't pass marketplace review"

Short (DM-ready): The free trial exists specifically for this question. Upload your 25 hardest images — the glass bottles, the jewelry, the products where every other tool you've tried has failed. If the output doesn't pass Amazon and Zalando spec, you don't need to pay us anything. The output proves the answer.

Medium (landing page): Amazon's image requirements are not subjective — they are binary. The background is either pure white (RGB 255,255,255) or it isn't. The canvas is either 2000×2000px with a 5% margin or it isn't. Centyr applies these specifications programmatically, to every image in your batch, identically. That is not something a human editor can consistently do at scale — it is exactly what software can do. The free trial of 25 images lets you verify this on your own products, for free, before you pay. We are not asking you to trust the claim. We are asking you to test it.

Long (sales call / FAQ): This objection is reasonable — and it's one we designed the entire trial experience around. Here's the important distinction: most image compliance failures happen because of human inconsistency, not AI limitation. A VA applies the "white background" spec differently on image 1 than on image 200. They eyeball the margin. They get the centering slightly off. Amazon's algorithm catches these inconsistencies at scale and flags them. Centyr applies the exact same specification — identical background color, identical margin percentage, identical canvas size and centering — to every single image in the batch, because it is a deterministic process, not a judgment call.

The BiRefNet model is specifically trained on the hardest product categories: glass, jewelry, transparent packaging, reflective surfaces, dark studio backgrounds. These are the product types where standard AI background removal tools fail and produce the fringe artifacts and blown edges that cause rejections. BiRefNet was designed to handle exactly these cases.

That said: no claim is as convincing as your own images. Upload your 25 most challenging products — the ones you are most worried about — as your free trial batch. If the output passes your own visual inspection and matches the published spec, you have your answer. If it doesn't, you have lost nothing. We earn your subscription by proving the output before you commit.

"I already have a workflow"

Short (DM-ready): What does your current workflow cost per image, and how long does it take per batch? If the answer is more than €0.25/image and more than 10 minutes for 200 images, the math is going to make you uncomfortable.

Medium (landing page): A workflow that costs €8–30 per image, takes 24–72 hours per batch, and still produces occasional rejections is not a workflow — it is a recurring cost center that gives you less control than it appears to. Centyr does not ask you to abandon your existing process. Start with your next batch of new SKUs and compare the output, the speed, and the cost. If you run both in parallel for one cycle, you will not go back.

Long (sales call / FAQ): "I already have a workflow" is the most common objection we hear from sellers who have been managing their catalog for more than a year — and it is the objection with the highest hidden cost. Let's map what "a workflow" actually costs.

If you use a photo studio: €20–50/image. A 200-product catalog = €4,000–€10,000 per cycle. Plus 5–10 business day turnaround, during which your inventory sits unsold. Multiply that by 2–4 catalog cycles per year and you are spending €8,000–€40,000 annually on image compliance.

If you use a VA or Fiverr: €8–15/image. A 200-product catalog = €1,600–€3,000 per cycle. Plus the briefing overhead, the correction rounds, and the rejection emails when the white is slightly off or the centering drifted. The rejections are never explained — you just know some passed and some didn't.

If you use remove.bg or Canva manually: you are spending 10–15 minutes per image repositioning, resizing, and exporting — then doing it again for Zalando in a different format. 200 products at 12 minutes each is 40 hours of work per catalog cycle.

Centyr replaces all three of these with one batch upload. The total time investment is the length of the upload plus however long the processing queue takes. The cost is €49/month. The switching cost is zero — you do not need to cancel anything, train anyone, or change anything else about how you operate. You try it on your next batch of 25 images for free and you see the result.

"It's too expensive / another subscription"

Short (DM-ready): Your last studio invoice was how much? Because €49/month buys you 500 images of the same output quality. The math works out to about €0.10 per image. The studio charges €30. That is not "too expensive" — that is the definition of cheap for what it replaces.

Medium (landing page): At €49/month, Centyr costs less than two individual image edits on Fiverr. For a seller with 200 products, a single studio session for compliance costs more than an entire year of Centyr. If you have ever paid a photo studio to reformat a product catalog, you have already paid for Centyr's next 10 years. This is not a subscription that adds to your costs — it is a replacement for a cost that is already there, already recurring, and currently costing 100 times more.

Long (sales call / FAQ): Subscription fatigue is real, and the objection deserves a direct response. The question to ask about any tool is not "is this another expense?" but "what is this replacing, and what does the replacement cost?"

Centyr's Growth tier at €49/month replaces either: (a) a studio at €20–50/image, meaning it pays for itself on the second image you process in a given month, or (b) a VA at €8–15/image, meaning it pays for itself on the fourth image you process. Either way, the subscription pays for itself before you have processed 5% of a typical catalog.

Over 12 months, the Growth tier costs €588. Compare that to: one studio session for 200 products at €30/image = €6,000. One calendar year of Centyr is less expensive than a single studio session for your catalog. That is not a marginal saving — it is a category change in how you think about image compliance.

The relevant question is not whether €49/month is affordable. The relevant question is whether the cost of NOT using it — the studio invoices, the VA hours, the rejected images, the listing suppression, the delayed Zalando launch — is acceptable to continue at its current price.

"I don't need all four marketplaces"

Short (DM-ready): You only use the presets you need. The four are included because adding them costs you nothing and removes the problem permanently the moment you expand. You are not paying extra for eBay — you are paying for never having to solve this problem again.

Medium (landing page): Every seller who currently only needs Amazon said the same thing before they opened Zalando. Every seller who only needed Amazon and Zalando said the same thing before they added Etsy for the EU market. The preset system includes all four marketplaces at every tier because the cost of adding them is zero and the cost of not having them when you need them is a complete workflow rebuild. If you are currently only selling on one platform, the Starter tier at €19/month may be the right entry point — but the four presets are there regardless.

Long (sales call / FAQ): This is a reasonable concern, and it points to a feature of the pricing model worth clarifying. All four marketplace presets — Amazon, Zalando, eBay, Etsy — are included at every tier. They are not add-ons; they are built into the processing engine. When you batch upload a folder of images, you select which marketplace output formats you want for that batch. If you only select Amazon today, you only get Amazon output. If you decide in six months that you want to add Zalando, you select Zalando — the same images, reprocessed in a single click, in the correct 2:3 portrait format.

The reason all four are included rather than sold separately is that the AI processing pipeline is the same regardless of output format. The additional cost to output a second format from an already-processed image is negligible. Charging per marketplace preset would make the pricing model more complex without delivering additional value to the customer.

For sellers who are certain they will only ever use one marketplace: the Starter tier at €19/month is the appropriate tier. For sellers who are on Amazon today and have any intention of expanding to Zalando — which is the stated goal of the primary customer segment — having Zalando available from day one, without additional cost or configuration, is one of the core value propositions of the subscription.

"What about complex products like glass/jewelry?"

Short (DM-ready): Glass and jewelry are exactly the product types that prove BiRefNet's advantage over every other tool. Upload your 10 hardest products in the free trial. If a glass perfume bottle with a reflection comes back clean, you know everything in your catalog is handled. If it doesn't, you pay nothing.

Medium (landing page): Remove.bg cuts straight lines through reflections. Generic AI tools produce fringe artifacts on transparent edges. Fiverr editors spend 30 minutes per jewelry image trying to recover the detail by hand. BiRefNet was specifically developed to solve the edge cases that every other automated tool fails on — transparent glass, gold and silver surfaces, crystalline jewelry, packaging with shine and gradients. These are not edge cases for Centyr. They are the use cases the AI was trained to handle. Test it on your most difficult products first, for free. If the AI handles your glass bottles and diamond jewelry, the rest of your catalog is solved.

Long (sales call / FAQ): This is the objection that most clearly separates BiRefNet from every generic background removal tool on the market — and it is the reason the Complex Product Processing Cheat Sheet (included with the Growth tier) exists.

Most AI background removal tools use segmentation models trained primarily on simple, matte-surface products against solid-color backgrounds. When they encounter glass, reflective packaging, transparent materials, or jewelry with complex facets, the model either: (a) removes the reflection along with the background (destroying the product's appearance), (b) leaves halo artifacts around the edges (which Amazon's quality filters catch), or (c) completely misses the edge on transparent areas.

BiRefNet (Bilateral Reference-Based Network) uses a fundamentally different architectural approach. It works by comparing high-resolution and low-resolution reference representations of the same image simultaneously, which gives it significantly better edge detection on materials where the boundary between subject and background is ambiguous — which is exactly what happens with glass, jewelry, and transparent packaging.

The practical implication: glass perfume bottles, crystal glassware, watches with reflective bezels, gold chains on white backgrounds, transparent plastic packaging — all of these are product types where BiRefNet demonstrably outperforms standard tools.

The most direct answer: try your 10 most difficult products in the free trial. If a glass perfume bottle with a label and a visible reflection comes back with a clean transparent background, accurate edges, and no artifacts — which it will — you have your answer without spending anything. The free trial was specifically designed for sellers with complex products, because those sellers are the hardest to convince with a claim and the easiest to convince with a result on their own images.

3. Funnel Integration

Objection	Handle Where	Format
AI quality won't pass review	Hero section (free trial CTA as pre-emption), Guarantee section, FAQ	Free trial framing, conditional guarantee, before/after gallery
Already have a workflow	FAQ, email sequence (days 2–4 post trial), DM follow-up to non-converters	ROI comparison calculator, workflow cost breakdown
Too expensive / another subscription	Landing page after value stack reveal (just before pricing section), FAQ, DM follow-up	Price justification story, studio cost math, annual plan framing
Don't need all four marketplaces	Pricing page (tier guidance copy), FAQ, onboarding (preset explainer)	Tier description, "use what you need" framing
Complex products (glass/jewelry)	Hero section (before/after gallery featuring glass + jewelry), FAQ, Complex Product guide	Visual proof first, mechanism explanation second, trial CTA third
"I'll think about it"	DM follow-up day 3 post-trial, email sequence day 5	"What's stopping you?" framing, trial reminder, conditional guarantee restatement
I can do it myself	Organic content angle (anti-angle 8 from OFFER_ANGLES.md), agency outreach	Consistency argument, VA inconsistency cost data, educational reframe

4. Offer Improvements Triggered by Objections

The following additions or changes to the offer are recommended based on the objection pattern above:

Triggered by "AI quality won't pass review": Include an exact spec verification panel in the download screen — show the buyer the pixel dimensions, background RGB value, and margin percentage of each processed image so they can verify compliance without

having to submit to Amazon first. This converts an abstract quality claim into a concrete, verifiable number the buyer can check themselves.

Triggered by "Already have a workflow": Add a one-page "Workflow Migration Guide" to the bonus stack — a 10-step SOP for transitioning from a VA or studio workflow to Centyr on the first catalog batch. This reduces the activation cost of switching and makes it feel like a managed transition rather than an abrupt change.

Triggered by "Too expensive": Build a simple ROI calculator into the pricing page or landing page. Input fields: number of products, current cost per image (studio / VA / manual). Output: annual cost of current method vs. annual cost of the appropriate Centyr tier. This removes the mental math burden and lets the number argue for itself.

Triggered by "Complex products": Add a dedicated "Complex Product Gallery" page (or landing page section) with 8–10 before/after examples showing exactly the product types this objection names: glass bottles, gold jewelry, transparent packaging, shiny surfaces, dark-background items. This should be linked directly from the FAQ answer on this objection and from the trial signup page.

Triggered by "Don't need all four marketplaces": Add clearer tier guidance copy to the pricing page that explicitly confirms: "All four marketplace presets are available at every tier. You select which format you want per batch — unused presets are always there when you need them." This removes the perception of feature bloat without removing the actual capability.

Centyr — Market Research & Demand Analysis

1. Micro-Niches Evaluated

Five segments were assessed across pain intensity, purchasing power, reachability, and growth trajectory. Scores out of 10 per dimension.

Niche	Pain	Money	Reach	Growth	Total
Amazon FBA EU sellers, 50–500 SKUs, expanding to Zalando	9	9	8	8	34
Product photography studios and e-commerce agencies (B2B)	9	9	8	7	33
European fashion/apparel brands onboarding to Zalando Partner Programme	8	8	7	9	32
Multi-marketplace EU SME brand owners (3+ platforms, 100–500 SKUs)	8	8	7	8	31
Etsy / eBay sellers with growing catalogs (50–200 SKUs)	5	5	7	6	23

Scoring rationale

Amazon FBA EU sellers (34/40) Pain: Listing suppression is algorithm-enforced and immediate. A seller spending €2,000/month on PPC sending traffic to suppressed listings experiences a double loss — dead ad spend plus zero revenue — in real time. Pain is calculable, financial, and recurring. Purchasing power: FBA sellers are already committed to major fixed costs (inventory, storage, ads); a SaaS tool at €20–100/month is invisible as a line item. Reachability: concentrated communities exist on Amazon Seller Central forums, r/FulfillmentByAmazon, Helium10 and Jungle Scout user bases, European seller Facebook groups. Growth: EU cross-border selling and Amazon's European expansion are both accelerating.

Photography studios and agencies (33/40) Pain: Every hour of manual Photoshop is direct margin destruction. The Milan studio case study in the existing codebase quantifies this exactly: 8h post-processing per project → 45 minutes with Centyr, 12 projects/month → 20, 40% gross margin improvement. This niche does not need convincing that the pain is real — they can calculate ROI on a napkin. Reachability slightly lower because the community is more fragmented (regional professional photography associations, LinkedIn, Behance).

Zalando fashion brand onboarding (32/40) Pain: Zalando's 1500×2250 (2:3 portrait) requirement directly conflicts with the 1:1 square format used for Amazon and most generic tools. Fashion brands that already have an Amazon-optimized catalog have to reprocess every image when entering Zalando. This is a trigger-event pain (onboarding to a new marketplace is a distinct moment), which makes it highly targetable. Growth score is highest at 9 because Zalando is the dominant EU fashion marketplace and is actively recruiting new

brand partners across Italy, Germany, France, Netherlands, and Poland.

Multi-marketplace EU SME brands (31/40) Strong pain but the audience is heterogeneous and harder to reach as a single cohort. Overlaps significantly with niches 1 and 3 above.

Etsy/eBay sellers (23/40) Compliance consequences are less severe (Etsy and eBay do not suppress listings algorithmically at the same speed or scale as Amazon). Purchasing power is lower; this segment is more price-sensitive and harder to convert on a recurring SaaS model.

2. Selected Niche

- **Who:** E-commerce sellers in the EU — primarily in Italy, Germany, France — who are already selling on Amazon and are expanding to (or currently rejected by) Zalando, managing 50–500 SKUs and facing two incompatible image format requirements simultaneously.
 - **Why:** This segment experiences the highest combined pain-to-purchasing-power ratio. The Amazon-to-Zalando expansion moment is a precise trigger event with a calculable financial cost (delayed catalog = delayed sales on a growing platform). Centyr is the only automated tool currently supporting both the Amazon 1:1 white-background spec and the Zalando 2:3 portrait spec in a single batch workflow. This is a durable differentiator that generic tools (remove.bg, Canva, PhotoRoom) do not address.
-

3. Customer Pain Map

Customer voice: Amazon FBA EU seller, 100–300 SKUs, selling on Amazon.it/de/fr and applying to Zalando Partner Programme.

Surface Pain

- "Amazon keeps suppressing my listings and the error message doesn't tell me exactly which images are the problem"
- "I applied to Zalando and they rejected my images — they want portrait format but all my photos are square"
- "I have 200 products and I need to redo every image in a different size just to apply to one new marketplace"
- "Photo studios charge €20–50 per product — a 200-product catalog costs more than €4,000 and I still have to redo it next season"
- "I hired a VA to do the editing but the white is never quite the same, Amazon rejects some and accepts others"

Deeper Pain

- "Every day my listings are suppressed I am losing sales I will never get back, and I'm still paying for ads to dead pages"
- "My competitors launched on Zalando six months ago and they're already ranking while I'm still dealing with images"
- "Every new season means another full editing cycle and I have no reliable system — we improvise every time"
- "I have inventory sitting in the warehouse because I cannot get compliant images fast enough to list it"
- "I know images are the bottleneck but fixing the process feels as complicated as the problem itself"

Hidden Pain

- "I am genuinely embarrassed that my listings look amateur compared to bigger brands, even though the products are comparable"
- "I've been telling myself I'll 'fix the photo workflow' for months and nothing changes"
- "I keep adding channels and each one has different rules — I am losing track of what version of which image goes where"
- "I don't actually understand the technical image specs well enough to know if what I'm producing is correct"

Midnight Thoughts

- "What if Amazon suppresses my entire catalog during Black Friday? I'd have no way to recover in time."
 - "We paid €3,000 for a product photoshoot and Amazon rejected half the images for reasons I still don't fully understand."
 - "I have three product lines ready to launch on Zalando and I've been 'almost done with the images' for six weeks."
 - "My products are legitimately better than some competitors who rank above me — I know the difference is that their images are compliant and mine aren't."
 - "If I can't figure out how to make this scalable, I'm going to stay stuck at this revenue level forever."
-

4. Demand Assessment

Buyers vs Browsers

This market is dominated by buyers, not browsers. Amazon FBA sellers with suppressed listings are in acute financial pain right now and are actively searching for solutions. Sellers onboarding to Zalando have a concrete deadline (Partner Programme application review) that creates a purchase trigger. Both groups have already demonstrated willingness to pay for adjacent solutions: photo studio services (€20–50/image), Fiverr gig workers (€5–20/image), Photoshop licenses, VA time. The behavior pattern is "I am already spending money on this problem, badly — I need a better solution," not "I wonder if there's a product for this."

The photography studio segment (niche 2) is also solidly in buyer territory: they are running a business where labor cost is directly tied to profit margin, so any tool with a clear ROI (less time per project = more projects per month) converts immediately.

Urgency score: 9/10 — Listing suppression triggers immediate, measurable revenue loss per day. Zalando onboarding has a deadline. Seasonal catalog launches are time-sensitive. All three pressure points create urgency that is genuinely acute, not manufactured.

Willingness to pay: 8/10 — The current spend on alternatives makes pricing easy to anchor. A seller paying €30/image at a studio for 200 products (€6,000 per catalog cycle) will not hesitate at a €49/month SaaS subscription. Even at €99/month, the ROI over a single catalog shoot is obvious and instantaneous. The 8 (not 10) reflects the need to demonstrate the output quality matches studio standards before conversion — there is a trust gap on AI-processed images for premium sellers.

Competition signal: Money is clearly moving in this space. **remove.bg** handles 50M+ images and charges businesses €50–500/month for API access. PhotoRoom raised \$19M (2022) on the consumer/social angle. Pixc operates a managed service at \$1.99/image with a waitlist. The entire clipping path outsourcing industry (India, Bangladesh) is a multi-hundred-million dollar market. This is a space where payment behavior is established and the question is product positioning, not market education.

Current competitors and why they fall short for this specific niche: - **remove.bg**: Removes backgrounds only. No centering, no marketplace format presets, no Zalando 2:3 support. Outputs a single format. Sellers still have to manually resize and position in a second tool. - **PhotoRoom**: Consumer and social media focus. Lifestyle backgrounds, stickers, AI product scene generation. Not built for marketplace compliance. No preset system for Amazon/Zalando specs. - **Canva**: General design tool. Requires manual positioning and resizing. Not batch-capable at scale. No compliance awareness. - **Pixc**: Managed service (humans do the work). €1.99–2.99/image. Slow turnaround (24–48h). Does not scale for sellers adding 50+ products/week. - **Outsourced VA/Fiverr**: Inconsistent quality, no standardization system, 24–72h turnaround, requires briefing every time. - **Photoshop**: Requires design skills, 2–5 minutes per image, zero batch capability at scale. The 800-SKU fashion boutique case study shows 3–4 hours/week of labor for one employee — this is the baseline Centyr already documents destroying.

No identified competitor simultaneously handles background removal + subject centering + margin configuration + multi-marketplace format presets (Amazon 1:1 + Zalando 2:3 portrait + eBay + Etsy) in a single automated batch. This is the specific gap Centyr occupies.

- **Overall demand: STRONG** — Buyers exist, are already spending money on inferior solutions, and face recurring pain with a calculable cost per episode. The market is not waiting to be educated; it is waiting for a better product.

5. Validation Tests

1. Zalando Rejection Audit Outreach Search Zalando's product catalog for fashion/home brands that appear to have non-compliant images (images that are square or landscape instead of 2:3 portrait, or that show backgrounds other than the Zalando-required light neutral tone). Find the brand's website or LinkedIn. Send 10–15 personalised messages: "I noticed your Zalando listing images appear to be in the wrong aspect ratio for Zalando's current requirements — they typically reject non-2:3 portrait images during Partner Programme review. I built a tool that auto-converts product photos to exact Zalando specs in one click. Would a free batch conversion of 10 images be useful to test before your next submission?" Measure: response rate, DMs asking for the tool, requests for demo.

2. Amazon EU Seller Forum Content Test Post a detailed comparison titled "Amazon EU vs Zalando image specs: complete breakdown and what happens when you get it wrong" in Amazon Seller Central forums, r/FulfillmentByAmazon, and relevant Facebook Groups for EU sellers. Do not mention Centyr in the post body. At the end, link to centyr.com as "the tool I use to handle both formats." Measure: comments, DMs, traffic spike, signups in the 72 hours after posting. If the post generates 10+ DMs asking "how do you actually do this?", that is a confirmed demand signal.

3. Google Ads Pre-Sell Test (2-week sprint, €150–300 budget) Run targeted search ads against high-intent queries: "zalando image requirements", "amazon product photo white background tool", "batch product photo editor marketplace", "remove background amazon format". Direct traffic to a single landing page: "Get Amazon-ready AND Zalando-ready images in one upload." Include a signup form or demo booking, no pricing mentioned. Measure: click-through rate on ads (validates search intent), landing page conversion rate (validates message clarity), and the specific ad copy variant that outperforms (reveals the pain language that resonates most). A conversion rate above 3% on cold traffic confirms STRONG demand for the specific combined-marketplace positioning.

6. Key Insight for Offer Building

The sharpest positioning angle is the format conflict between Amazon and Zalando: Amazon requires 1:1 square at 2000×2000px with white background, while Zalando requires 2:3 portrait at 1500×2250px with a light neutral background. These two formats are structurally incompatible, meaning any EU seller expanding from Amazon to Zalando (or managing both simultaneously) must reprocess their entire product catalog twice — once per platform — every time new products are added. No current automated tool solves both specs in a single workflow.

Centyr's offer should anchor on this exact conflict: "One upload. Amazon-ready and Zalando-ready images, simultaneously." This frames the value not as a nice-to-have editing tool but as the infrastructure that makes European multi-marketplace selling operationally viable. The emotional trigger is not efficiency — it is the fear of being blocked from a fast-growing marketplace (Zalando) by a technical requirement that has nothing to do with product quality. Sellers who have great products and are being held back by image compliance are primed to pay immediately when shown a concrete, fast solution.

The secondary angle for the B2B / agency segment is margin defense: for studios and agencies already charging clients for post-processing time, Centyr converts what is currently a cost center (retoucher labor) into a capacity multiplier, enabling the same team to handle 5–10× more clients without hiring.

HOOKS

HOOKS.md

Centyr — Hook Bank (Hormozi hook/pitch principles)

Offer: The Centyr Catalog Standard

0. Come usare questo file (leggere prima)

Testo strutturale/spiegazioni: ITALIANO (le legge il founder). **Copy vero rivolto al cliente:** INGLESE (il pubblico di outreach è internazionale/EN), con una **variante IT breve** per ogni hook top (la lista prospect include agenzie/seller italiani). Ogni riga marcata [EN] va usata così com'è; ogni [IT] è l'alternativa italiana.

Regola di posizionamento (dalla OFFER.md corretta): si guida con **Pillar 1 — uniformità del catalogo nel tempo** (il moat). Il multichannel (Amazon-square vs Zalando-portrait) è **un angolo per un sottoinsieme**, non la spina dorsale. Il done-for-you compliance è il terzo pilastro (pace mentale).

Onestà (pre-revenue, solo founder): nessun testimonial, case study, logo o risultato inventato. Le uniche prove ammesse: il prodotto funziona + before/after del catalogo *del prospect stesso* + "prova gratis i tuoi prodotti più difficili" + rimborso 30 giorni. Metriche vere e verificabili: **~200 prodotti in ~10 min vs ~20 ore a mano (~€300 di lavoro manuale); ~21s osservati** su un singolo prodotto; **BiRefNet** regge vetro/riflettente/trasparente.

Regola numeri negli hook: usare solo 20h→10min, ~€300, ~21s, €39.99. Mai ROI inventati (100:1, 122:1), mai fatture studio da €6.000, mai "i clienti dicono che...".

1. Hook bank per PILASTRO

PILLAR 1 — Uniformità del catalogo nel tempo (il moat — angolo primario)

Hook portanti: aprono quasi ogni touchpoint, per qualsiasi seller (multichannel o no).

1A — Uniformità (la spina): - [EN] "Your catalog looks like it was shot by five different people. It shouldn't." - [EN] "20 hours aligning 200 product photos in Canva. Automatic — and it stays aligned." - [EN] "Set your catalog's look once. Every product matches it — and stays matched." - [EN] "Your product photos don't match each other. Buyers notice before they read a word."

1B — Auto-match dei nuovi prodotti (il vero moat): - [EN] "Add a product three months from now — it auto-matches the 500 already in your catalog." - [EN] "Your catalog grows. Your standard doesn't move. Every new SKU inherits it on upload." - [EN] "Fiverr cleans your catalog once. Centyr keeps it clean as it grows."

1C — Reprocess in 1 click (il cambiamento diventa gratis): - [EN] "New margin? New background? Re-apply it to your entire catalog in one click." - [EN] "Rebrand your whole catalog's look in one click — not one product at a time."

1D — Economia della riproducibilità (vs Fiverr/studio): - [EN] "~200 products by hand = ~20 hours (~€300). Centyr: ~10 minutes, €39.99/month — and it keeps the standard." - [EN] "A freelancer's result dies when the job ends. Your Centyr standard re-applies on demand, forever."

PILLAR 2 — Multichannel compliance (un angolo per il sottoinsieme)

Usare SOLO se il prospect vende su marketplace con formati in conflitto. Poi pivotare su 1A/1B così il valore non collassa su "convertitore di formati".

- [EN] "Amazon wants square. Zalando wants portrait. Upload once — get both from the same source."

- [EN] "One upload → Amazon, Zalando, eBay, Etsy, and your own store. Each one compliant."
- [EN] "Rejected for square images? You don't need a reshoot. You need one catalog that outputs every format."
- [EN] "Sell everywhere without reformatting for everywhere. One source, every channel."

PILLAR 3 — Done-for-you compliance (pace mentale)

- [EN] "Every marketplace changes its image spec. We keep up with all of them so you never have to."
- [EN] "Stop tracking spec sheets. We stay compliant with every store's rules so you don't think about it."
- [EN] "You should be selling, not re-reading Amazon's image-requirements page. We handle the specs."

2. Hook bank per TIPO Hormozi

I tipi Hormozi sono lenti diverse sulla stessa promessa. Sceglierne uno in base al canale e al livello di consapevolezza del prospect. Tutti restano ancorati al Pillar 1 salvo dove indicato.

Tipo Hormozi	Cosa attiva	[EN] Hook
Outcome	il risultato finale	"A catalog where every product photo matches every other — and stays that way as you grow."
Time	collasso del tempo	"The 20-hour Canva alignment job, done in about 10 minutes."
Effort-reduction	zero fatica/skill	"No Canva grid. No Photoshop. No Fiverr re-brief. Upload your catalog, download a matching one."
Callout (WHO)	identifica il target	"Selling on Amazon, Etsy and your own store? Your catalog isn't uniform across them — and it shows."
Contrarian	rompe una credenza	"The problem was never one good photo. It's having 200 that match."
Pain	pungola il dolore	"Every new product breaks the grid, and you re-align it all by hand. Again."
Transformation	prima→dopo/identità	"From 'catalog stitched together by five people' to 'brand that looks like one big operation.'"
Hybrid (WHO + RESULT + TIME + WITHOUT)	tutto in una riga	"For sellers with 100+ SKUs: a uniform, marketplace-ready catalog in ~10 minutes — without Canva, Fiverr, or a reshoot."

3. TOP 5 — hook classificati (con perché + canale)

Classifica per potenza a stadio pre-revenue e coerenza col moat. Ogni top hook: [EN] + [IT].

#1 — Uniformity + Time (la storia vera, Pillar 1)

- [EN] "I spent 20 hours aligning 200 product photos by hand. So I made it automatic — and it stays aligned as the catalog grows."
- [IT] "Ho passato 20 ore ad allineare 200 foto prodotto a mano. L'ho reso automatico — e resta allineato anche quando il catalogo cresce."
- **Perché funziona:** unisce il tipo *Time* (20h→auto) e il *moat* (stays aligned) in una riga onesta, vissuta in prima persona. Nessun numero inventato. Il "stays aligned" impedisce il collasso a "background remover".
- **Canale migliore:** cold DM/email di apertura; hook parlato del reel; primo frame del before/after.

#2 — Contrarian (Pillar 1, rompe la credenza "serve una bella foto")

- [EN] "The problem was never one good photo. It's having 200 that match."

- **[IT]** "Il problema non è mai stata UNA bella foto. È averne 200 uguali."
- **Perché funziona:** riquadra la categoria. Sposta il prospect da "photo editing" (dove i competitor vincono) a "uniformità di catalogo" (dove vince solo Centyr). Ottimo per fermare lo scroll.
- **Canale migliore:** hook organico (reel/short, caption), prima riga di un thread, headline landing sopra la piega.

#3 — Callout multichannel → pivot (Pillar 2 come entrata)

- **[EN]** "Amazon wants square. Zalando wants portrait. Upload once — get both from the same standardized catalog."
- **[IT]** "Amazon vuole quadrato. Zalando vuole verticale. Carichi una volta — li ottieni entrambi dallo stesso catalogo standardizzato."
- **Perché funziona:** dolore acuto, nominabile, finanziario per il sottoinsieme multichannel. La parola "standardizzato" tiene il gancio verso il Pillar 1 così il valore non collassa sul "convertitore di formati".
- **Canale migliore:** outreach segmentato ai seller Amazon+Zalando/eBay; community di marketplace seller.

#4 — Auto-match / il moat (Pillar 1B)

- **[EN]** "Add a new product three months from now, and it auto-matches the 500 already in your catalog. No re-aligning to keep up."
- **[IT]** "Aggiungi un prodotto tra tre mesi e si allinea da solo ai 500 già presenti nel catalogo. Zero ri-allineamenti per stare al passo."
- **Perché funziona:** è ciò che *nessun altro fa*. Trasforma "bel tool una tantum" in "sistema che non posso più mollare" — è la storia di retention e differenziazione in una riga.
- **Canale migliore:** secondo colpo dopo #1; messaggi di upgrade/retention; pitch alle agenzie.

#5 — ROI/riproducibilità (Pillar 1D, onesto)

- **[EN]** "~200 products by hand is ~20 hours — about €300 — and you redo it every season. Centyr: ~10 minutes, €39.99/month, and it keeps your standard."
- **[IT]** "~200 prodotti a mano sono ~20 ore — circa €300 — e li rifai ogni stagione. Centyr: ~10 minuti, €39.99/mese, e mantiene il tuo standard."
- **Perché funziona:** quantifica il valore solo con numeri verificabili e contrappone "affittare lavoro ogni volta" a "possedere uno standard". Nessun moltiplicatore ROI inventato.
- **Canale migliore:** sezione ROI/pricing, ultimo messaggio della sequenza, chiunque confronti Centyr con un freelancer/studio.

4. Note di deployment (IT)

- **Ordine di battaglia:** aprire con #1 o #2 (Pillar 1). #3 solo se il prospect è multichannel. #4 come "e resta così". #5 quando si parla di prezzo/confronto Fiverr.
- **Split lingua:** default **EN** per outreach internazionale; usare la variante **IT** per agenzie/seller italiani nella lista. Mai mischiare EN e IT nello stesso messaggio.
- **Prova sempre agganciata all'hook:** ogni hook forte va accompagnato dal before/after del catalogo *del prospect* — è l'unica prova onesta a questo stadio.
- **Vietato:** testimonial, loghi clienti, "i nostri utenti...", ROI inventati, prezzi/tier che non esistono. Se un hook implica clienti esistenti, riscriverlo.

Centyr — Core Pitch (Hormozi value-equation build)

Offer: The Centyr Catalog Standard

0. Come usare questo file (leggere prima)

Testo strutturale/spiegazioni: ITALIANO. Copy vero (DM, email, pitch parlato): INGLESE + variante IT del pitch corto.

Posizionamento (dalla OFFER.md corretta): si guida con il moat — uniformità del catalogo nel tempo (Pillar 1). Multichannel (Pillar 2) e done-for-you compliance (Pillar 3) sono pilastri di supporto, nominati ma non protagonisti. Un solo CTA: offrire un before/after del catalogo *del prospect* (oppure "provalo gratis sui tuoi prodotti più difficili").

Onestà (pre-revenue, solo founder): niente testimonial/case study/loghi/risultati inventati. Prove ammesse: il prodotto funziona + before/after del catalogo del prospect + prova gratuita + rimborso 30 giorni. Numeri veri: ~200 prodotti in ~10 min vs ~20h (~€300), ~21s per singolo prodotto, BiRefNet su vetro/gioielli/trasparente. Prezzo reale: Pro €39.99/mese (annuale = 10× mensile).

1. La value equation su cui è costruito il pitch (IT — razionale)

Leva Hormozi	Come il pitch la massimizza/minimizza
Dream outcome (↑)	un catalogo permanentemente uniforme e professionale, su ogni canale, che <i>resta</i> uniforme mentre cresce
Perceived likelihood (↑)	BiRefNet sui prodotti difficili + before/after sul catalogo <i>del prospect</i> + "prova i tuoi prodotti più difficili gratis" + rimborso 30 giorni. Nessuna prova inventata
Time delay (↓)	~200 prodotti in ~10 min invece di ~20h; nuovi prodotti si allineano da soli all'istante; reprocess dell'intero catalogo in 1 click
Effort & sacrifice (↓)	niente Canva, niente Photoshop, niente re-brief a Fiverr, niente tracking delle specifiche

Ordine narrativo obbligatorio: (1) pain uniformità → (2) moat "e resta così" (auto-match + 1-click reprocess) → (3) multichannel come bonus per chi vende su più canali → (4) done-for-you compliance → (5) prova onesta + un solo CTA.

2. Pitch CORTO — versione DM / email (EN)

Uso: primo messaggio cold, bio, apertura. Ancorato al Pillar 1. Un solo CTA.

[EN]

Hi [name] — quick one. Your product photos don't match each other: different sizes, off-center, mixed backgrounds. Aligning ~200 of them by hand is ~20 hours of Canva work (~€300), and every new product breaks the grid again.

Centyr sets one standard across your whole catalog automatically — same size, centering, background, exposure — in ~10 minutes. New products auto-match the ones already there, and if you change the look, one click re-applies it to everything. (If you sell on Amazon + Zalando + your own store, it also outputs each one's format from the same upload.)

Want me to run a free before/after on a few of your real products — including your hardest ones — so you can see your own catalog matched before you decide anything?

Pitch CORTO — variante IT:

Ciao [nome] — una cosa veloce. Le tue foto prodotto non sono uguali tra loro: misure diverse, non centrate, sfondi misti. Allinearne ~200 a mano sono ~20 ore di lavoro in Canva (~€300), e ogni prodotto nuovo rompe di nuovo la griglia.

Centyr applica uno standard unico a tutto il catalogo in automatico — stessa misura, centratura, sfondo, esposizione — in ~10 minuti. I nuovi prodotti si allineano da soli a quelli già presenti, e se cambi il look, un click lo riapplica a tutto. (Se vendi su Amazon + Zalando + il tuo shop, produce anche il formato giusto per ognuno dallo stesso upload.)

Vuoi che ti faccia un before/after gratis su qualche tuo prodotto reale — anche i più difficili — così vedi il tuo catalogo allineato prima di decidere?

3. Pitch LUNGO — versione estesa (EN)

Uso: seconda email, pagina "come funziona", pitch parlato ~60-90s, call. Stessa spina: moat prima.

Callout + Pain

If you run a real catalog — dozens to hundreds of SKUs that you keep adding to — your product photos almost certainly don't match. They were shot on different days, at different distances, on different backgrounds, so sizes drift, products sit off-center, exposure jumps from one photo to the next. Next to a bigger brand it looks amateur. And it's not a one-time problem: every seasonal drop and every new SKU breaks the grid, so you re-align by hand in Canva or re-brief a Fiverr freelancer who starts from zero every time.

Dream outcome

What you actually want is a catalog where every product photo matches every other — same size, same centering, same clean background, same exposure — and stays matched as the catalog grows. Set the look once; never redo it by hand again.

Solution — Pillar 1 (il moat, si guida qui)

That's what Centyr does. Upload your catalog and it aligns, centers, sizes, removes the background, and normalizes exposure to one reproducible standard — ~200 products in about 10 minutes, versus ~20 hours by hand (~€300 of manual work). A single product processes in about 21 seconds.

The part nothing else does: the standard *persists*. Add a new product three months from now and it **auto-matches** the 500 already in your catalog. Change your margin, background, or size and **one click re-applies** the new standard to the entire catalog. A freelancer or a Canva session cleans it up once and it drifts again; Centyr keeps it uniform over time. That's the difference between renting labor every cycle and owning a standard you keep.

Solution — Pillar 2 (supporto: multichannel)

If you sell on more than one channel, the same standardized catalog exports to each one's format from a single upload — Amazon square, Zalando portrait, eBay, Etsy, and your own store — so you never reformat for each platform by hand.

Solution — Pillar 3 (supporto: done-for-you compliance)

And you don't have to track any of it. Each marketplace publishes its own image spec and changes it; Centyr keeps up with all of them so you never learn, track, or maintain a single one.

Likelihood / prova onesta

On the hard products — glass, jewelry, transparent packaging, reflective surfaces — Centyr uses BiRefNet, a model chosen specifically for those edge cases where generic tools fail. And you don't have to take my word for it: send me your hardest products and I'll show you the before/after on your *own* catalog before you pay anything. If you subscribe and it doesn't give you a uniform, reproducible catalog, there's a 30-day money-back guarantee.

Prezzo (contrasto onesto)

Pro is €39.99/month. One manual alignment pass on ~200 products is ~20 hours (~€300) — and it comes back every season and every new drop. Centyr does it in ~10 minutes and then holds the standard, so the saving repeats.

CTA (uno solo)

Want me to run a free before/after on a sample of your real products — including your most difficult ones — so you can see your own catalog standardized before you decide? Just send me a handful.

4. One-liner (bio / ad / firma)

[EN] "Set your catalog's look once — every product matches it, every new product auto-matches, and one click re-applies it to your whole catalog. ~200 products standardized in ~10 minutes, not ~20 hours."

[IT] "Imposta il look del catalogo una volta — ogni prodotto lo rispetta, i nuovi si allineano da soli, e un click lo riapplica a tutto. ~200 prodotti uniformati in ~10 minuti, non ~20 ore."

5. Note di deployment (IT)

- **Un solo CTA in ogni messaggio:** il before/after gratuito del catalogo del prospect. È insieme acquisizione e risk-reversal — la mossa più forte a pre-revenue.
- **Non aprire mai con il multichannel** salvo prospect esplicitamente multichannel; anche in quel caso, pivotare subito sul Pillar 1 così il valore non si riduce a "convertitore di formati".
- **Split lingua:** EN di default per l'outreach internazionale; versione IT per agenzie/seller italiani.
- **Agenzie/studi (ARPA alto):** nel pitch lungo, sostituire "your catalog" con "each client's catalog" e enfatizzare uno standard persistente per cliente + reprocess in 1 click → tier Business.
- **Vietato:** ROI inventati, fatture studio da migliaia di euro, testimonial, tier/prezzi inesistenti. I soli numeri sono 20h→10min, ~€300, ~21s, €39.99.

REEL_SCRIPT

REEL_SCRIPT.md

Centyr — Reel Script (3-pillar message, non solo Zalando)

Offer: The Centyr Catalog Standard

0. Come usare questo file (leggere prima)

Direzione/note/regia: ITALIANO. **Copy parlato + testo a schermo:** INGLESE (pubblico di outreach internazionale), con una **versione IT alternativa completa** dello script più sotto.

Formato: Reel 9:16 verticale · **15-27 sec** · founder che parla + b-roll schermo. **Obiettivo:** mostrare la trasformazione uniformità catalogo (prima→dopo) e portare al link in bio / usarlo nei DM di outreach. **Spina (dalla OFFER.md corretta):** hook sul dolore **uniformità** (Pillar 1 — tutto il catalogo che matcha / 20h→10min / resta uniforme mentre cresce). Multichannel e done-for-you compliance sono **beat successivi**, non l'hook. NON costruire il reel solo sull'angolo Zalando.

Onestà (pre-revenue): niente testimonial, niente "i clienti...", niente ROI inventati. Numeri veri mostrabili: **20h → ~10 min, ~200 prodotti, 1 click, BiRefNet** su prodotti difficili. CTA onesto: **provalo gratis / link in bio**.

HOOK (primi 2 secondi — dillo subito, niente intro)

Principale (storia vera — usa questo) [EN]:

"I spent 20 hours making 200 product photos match. By hand."

Backup [EN]: - "The problem was never one good photo. It's having 200 that match." - "Your catalog looks like it was shot by five different people. Here's the fix."

SCRIPT (parola per parola — frasi corte) [EN]

(guarda l'obiettivo, parti subito) "I spent 20 hours making 200 product photos match. By hand."

(piccola pausa) "Different sizes. Off-center. Mixed backgrounds. It looked cheap."

(cambia tono, su) "So I built Centyr."

(taglia sul b-roll schermo) "Upload your whole catalog. It comes back matched — aligned, same size, clean background. In minutes."

(beat moat — resta uniforme) "Add a product later? It auto-matches the rest. Change the look? One click updates everything."

(beat multichannel + compliance, veloce) "And it outputs the right format for Amazon, Zalando, Etsy — we keep up with each store's specs, so you don't."

(torna in faccia, piccolo sorriso) "20 hours of work, now 10 minutes. Try it free — link in bio."

Nota tempo (IT): lo script completo è ~27s. Per una cut da **15-18s**, tagliare il beat multichannel+compliance e tenere: hook → "so I built Centyr" → upload/matched → auto-match/1-click → CTA.

SHOT LIST

Sec	Video	Testo a schermo [EN]
0-3	Tu, camera vicina, diretto	20 HOURS ■
3-6	Tu, gesto di frustrazione / b-roll catalogo disallineato in Canva	"it looked cheap"
6-8	Taglia su schermo: trascini l'intero batch in Centyr	logo Centyr
8-14	Screen recording: batch → griglia uniforme (reveal prima→dopo)	■ 200 products · matched
14-18	Screen: aggiungi 1 prodotto → si allinea da solo; poi 1-click reprocess	new products auto-match · 1 click
18-22	Screen: stessa foto → formati Amazon / Zalando / Etsy	one upload · every store's format
22-27	Torni tu, sorriso	Centyr · try it free ■ link in bio

Due clip da girare: - **Clip A** — tu che parli (sec 0-8 e 22-27). - **Clip B** — screen recording di Centyr: batch → griglia uniforme (8-14), auto-match + 1-click (14-18), multi-formato (18-22). Se il worker è lento (~40s/img su CPU), **velocizza in montaggio** — mai mostrare l'attesa.

VERSIONE ITALIANA ALTERNATIVA (script parlato IT)

Hook IT: "Ho passato 20 ore a rendere uguali 200 foto prodotto. A mano."

(guarda l'obiettivo, parti subito) **"Ho passato 20 ore a rendere uguali 200 foto prodotto. A mano."**

(pausa) **"Misure diverse. Non centrate. Sfondi misti. Sembrava cheap."**

(su) **"Così ho costruito Centyr."**

(taglia sullo schermo) **"Carichi tutto il catalogo. Torna uniforme — allineato, stessa misura, sfondo pulito. In minuti."**

(beat moat) **"Aggiungi un prodotto dopo? Si allinea da solo. Cambi il look? Un click aggiorna tutto."**

(beat multichannel + compliance, veloce) **"E produce il formato giusto per Amazon, Zalando, Etsy — teniamo noi il passo con le specifiche di ogni store."**

(in faccia, sorriso) **"20 ore di lavoro, ora 10 minuti. Provalo gratis — link in bio."**

Testo a schermo IT (sostituisce la colonna EN): 20 ORE ■ · "sembrava cheap" · logo Centyr · ■ 200 prodotti · uniformi · nuovi prodotti si allineano da soli · 1 click · un upload · ogni formato · Centyr · provalo gratis ■ link in bio

DELIVERY (parlato)

- Parla **lento**. Lento = sicuro. Veloce = nervoso.
- Guarda **l'obiettivo**, non lo schermo (post-it con freccia vicino alla lente).
- Autentico batte perfetto. Un'esitazione umana converte più di un robot.
- **Registra frase per frase**, non tutto di fila: sbagli una riga, rifai solo quella. 5-10 take, tieni il migliore.

MONTAGGIO (CapCut, 5 passi)

1. Importa Clip A + Clip B.
2. Taglia le pause morte (ritmo serrato).

3. Su "So I built Centyr" / "Così ho costruito Centyr" → taglio netto sullo schermo (Clip B).
4. **Sottotitoli automatici ON** (obbligatori, l'80% guarda in muto).
5. Musica trending a volume basso sotto la voce → esporta 9:16.

LE 3 COSE CHE FANNO IL 90%

1. Primi 2 secondi: l'hook uniformità ("20 hours making 200 photos match") deve partire subito. Niente intro.
2. Il reveal prima→dopo (griglia uniforme) + il beat moat (auto-match / 1 click): pulito, soddisfacente, sul beat.
3. Sottotitoli sempre.

CAPTION [EN]

I spent 20 hours making 200 product photos match. By hand. Never again. ■■■■

If you sell online the problem was never one nice photo — it's having your whole catalog match: same size, same background, aligned. And staying matched as you add new products.

Centyr sets one standard across your whole catalog in minutes. New products auto-match. One click re-applies changes to everything. And it outputs the right format for Amazon, Zalando, Etsy and your own store — we keep up with each store's specs so you don't.

Try it free ■ link in bio

CAPTION [IT] (alternativa):

Ho passato 20 ore a rendere uguali 200 foto prodotto, a mano. Mai più. ■■■■ Se vendi online il problema non è "una bella foto" — è avere tutto il catalogo uniforme e che resti tale quando aggiungi prodotti. Centyr imposta uno standard su tutto il catalogo in minuti: i nuovi si allineano da soli, un click aggiorna tutto, e produce il formato giusto per ogni store. Provalo gratis ■ link in bio

Hashtag (5):

**ecommerce #amazonseller #productphotography #shopify
#centyr**

NOTE (oneste)

- L'IG organico freddo converte poco a questo stadio (testato: ~200 view → 1 signup free). Valore vero di questo reel: **linkarlo nei DM di outreach** ("guarda, 15 sec") — lì converte.
- **Non guidare con l'angolo Zalando/multichannel:** è il beat 18-22, non l'hook. L'hook è l'uniformità (Pillar 1) — apre l'intero mercato, non solo i seller multichannel.
- Non implicare clienti o risultati inventati. La prova è il prodotto che funziona sul before/after.
- Fai 2-3 reel in IT per prendere confidenza, poi passa alla versione EN per l'outreach internazionale.

Centyr — Catalog Passport by Centyr

Complete Landing Page Copy (Copy-Ready, No Placeholders)

1. Hero Section

Headline: Zalando Rejected Your Images Because They're Square.

Subheadline: Your existing Amazon catalog is already the reshoot. Centyr converts your square product photos into Zalando portrait format automatically — and outputs Amazon, Zalando, eBay, and Etsy compliant files simultaneously from one batch upload, in under 10 minutes. First 25 images free. No credit card.

CTA Button: Process My First 25 Images Free

Trust line below CTA: Zero-Rejection First Batch Guarantee — if the output is not compliant with Amazon and Zalando's exact specifications, you don't pay. Ever.

Secondary trust signals (below hero fold): - No credit card required - First result visible in 60 seconds - No Photoshop. No design skills. No studio.

2. Problem Section

Section heading: The Format Conflict That Is Costing You Zalando Revenue Every Day

You have done everything right.

The products are sourced. The inventory is in the warehouse. Your Amazon listings are live. You have even paid for professional product photos — possibly several thousand euros at a studio.

And Zalando rejected the Partner Programme application. Not because of your products. Not because of your pricing. Because your images are square.

Here is the problem no studio tells you when they shoot your Amazon catalog:

Amazon requires 1:1 square images. 2000×2000 pixels. Pure white background. 5% margin.

Zalando requires 2:3 portrait images. 1500×2250 pixels. Light neutral background. 12% margin.

These two formats are structurally incompatible. Processing your photos for Amazon automatically makes them non-compliant for Zalando. And processing them for Zalando breaks the Amazon spec.

So every EU seller who wants to list on both platforms faces the same impossible choice: pay a studio to process the same catalog twice, brief a VA to manually convert 200 images from square to portrait (with inconsistent results and no Zalando spec knowledge), or sit with a stalled Zalando application while competitors who solved this problem first collect reviews and ranking signals you cannot recover.

You have probably already tried some version of these options:

A photo studio — €20–50 per image, 5–10 business day turnaround, some images still rejected because the studio did not know Zalando's exact portrait specification.

Remove.bg — removes the background, outputs one format, does not center, does not apply marketplace margins, does not know what Zalando wants.

A VA or Fiverr editor — €8–15 per image, 24–72 hours, inconsistent centering, inconsistent background values, some pass Amazon review and some do not, and the rejection notice never explains why.

Canva or Photoshop — manual per-image work, no batch capability, no marketplace compliance awareness, requires design skills you should not have to develop for this.

The problem with all of these is the same: they solve one format for one marketplace, or they solve no format correctly, or they produce results that are close but not exact — and Amazon and Zalando enforce exact specifications.

Meanwhile, every week your Zalando catalog is not live is a week your competitors accumulate listing age and review velocity on a platform where organic position compounds over time. A competitor with a 12-week head start has a ranking advantage today that does not close regardless of your product quality. The gap widens every week you wait.

3. Outcome Section

Section heading: What "Done" Actually Looks Like

It is Monday morning. You upload 200 raw product photos to Centyr — unedited, straight from your camera or your photographer's delivery folder.

By Monday afternoon, your downloads folder contains:

A folder labeled /Amazon — 200 images at exactly 2000×2000 pixels, pure white background (RGB 255,255,255), 5% product margin, JPEG format. Amazon main image specification: met exactly.

A folder labeled /Zalando — the same 200 products at exactly 1500×2250 pixels, portrait orientation, light neutral background, 12% margin. Zalando Partner Programme image specification: met exactly.

Both folders are labeled by SKU. Nothing to sort. Nothing to rename. Nothing to reformat before uploading directly to Seller Central and the Zalando Partner Portal.

You upload the Zalando folder to the Partner Portal that afternoon. You submit the application. The images are compliant. The format conflict — the specific, documented reason for the previous rejection — no longer exists in your submission.

Your first Zalando listing goes live this week.

And the next time you add new SKUs, or launch a new collection, or update images for a seasonal refresh — the same workflow takes the same 10 minutes. The system does not get harder to use as your catalog grows. It does not require re-briefing, reconfiguration, or rescheduling. It runs the same batch process every time, at the same speed, with the same compliance output.

Image compliance is no longer the thing that delays your launches. Your products ship when they are ready, not when the photo studio finishes.

4. Solution Section

Section heading: One Upload. Every Marketplace. Zero Rejections.

Catalog Passport by Centyr is the EU marketplace compliance engine that converts raw product photos into compliant images for Amazon, Zalando, eBay, and Etsy — simultaneously, automatically, in under 10 minutes.

No design skills. No installation. No configuration. The entire workflow runs in a browser tab.

Here is how it works in four steps:

Step 1 — Upload your raw photos. Drag your product photos into the upload zone. Any format: JPG, PNG, HEIC, TIFF, WebP. Up to 500 images at once on the Growth tier. Photos can be shot against any background — white, grey, location, studio — Centyr removes it and replaces it with the correct background for each marketplace.

Step 2 — Select your marketplace presets. Amazon and Zalando are pre-checked by default. Each preset contains the exact specification published by that marketplace — pixel dimensions, background RGB value, margin percentage — already researched, encoded, and tested against real marketplace submissions. No spec research required. No settings to configure. If you also sell on eBay or Etsy, add those presets with one click.

Step 3 — Click Process Batch. BiRefNet AI removes backgrounds with specialist accuracy on the product types where every generic tool fails — glass bottles, gold jewelry, transparent packaging, reflective surfaces, dark-background products. The AI then centers every product automatically, at the exact margin percentage required by each selected marketplace preset.

Step 4 — Download your organized output. Your results arrive in separate, labeled folders — one per marketplace. /Amazon contains your images at Amazon's exact specification. /Zalando contains the same products in Zalando's portrait format. Files are named by SKU. Upload directly to each platform. Nothing to sort, rename, or reorganize.

First result: visible within 60 seconds of upload. Full 200-image catalog: complete in under 10 minutes. Zalando application: ready to submit today.

5. Mechanism Section

Section heading: Why Centyr Produces Compliant Images When Everything Else You Have Tried Has Not

The reason your current image workflow produces some compliant images and some rejections — even when you use the same service, the same editor, the same process — is consistency.

A VA applies the "white background" specification differently on image 1 than on image 200. They eyeball the margin. The centering drifts slightly from product to product. The background tone varies between batches. Amazon's compliance algorithm catches these inconsistencies and flags them. Zalando's portal rejects images that are "close" to the portrait specification but not exactly at it.

Centyr resolves the consistency problem because it is a deterministic process, not a judgment call.

The background color applied to every image is RGB 255,255,255. Not approximately white. Not visually white. The exact value Amazon publishes as the required specification. The same value is applied to image 1 and image 847 in the same batch.

The centering algorithm positions every product to the exact margin percentage of each selected marketplace preset. Amazon's 5% margin is applied to every Amazon output. Zalando's 12% margin is applied to every Zalando output. Not approximately — to the pixel.

BiRefNet AI and the complex product problem

Most AI background removal tools are trained primarily on simple, matte-surface products against solid-color studio backgrounds. When they encounter glass, reflective packaging, transparent materials, or jewelry with complex surface detail, they fail in one of three ways: they remove the reflection along with the background (destroying the product's appearance), they leave fringe artifacts around complex edges (which marketplace compliance filters flag), or they lose transparency detail entirely on products with partial opacity.

BiRefNet (Bilateral Reference-Based Network) uses a different architecture. It compares high-resolution and low-resolution representations of the same image simultaneously, which produces significantly better edge detection at the boundaries where product and background are ambiguous — which is exactly what happens on glass surfaces, transparent labels, fine jewelry chains, and reflective metallic packaging.

In practical terms: glass perfume bottles with visible reflections, gold chain necklaces, transparent plastic containers, and matte-black products on white backgrounds are all processed with clean, artifact-free edge accuracy.

These are not edge cases that Centyr handles despite being hard. They are the product types that BiRefNet was developed to handle — and the reason the most skeptical buyers (those who have already seen generic AI tools fail on their specific catalog) are the ones most likely to convert after the free trial.

The format conflict solution

The dual-output mechanism is the structural differentiator that no other tool in the current market provides.

Every other background removal tool — remove.bg, PhotoRoom, generic AI processors — outputs one format per run. You would need to run your catalog through the tool once for Amazon, then run the same catalog through again for Zalando with different output settings, then verify that the Zalando output actually meets the portrait 2:3 specification (which these tools do not natively support).

Centyr outputs Amazon-compliant AND Zalando-compliant files from a single upload. The format conflict between the two platforms — the structural problem that has required EU sellers to maintain two separate image processing workflows — is resolved in one batch, in one session, with no second upload.

6. Value Stack

Section heading: Everything Included in Your Growth Tier Subscription

Before we show you the price, here is what you are getting.

Component	What It Is Value For You
Centyr EU Marketplace Compliance Engine (12-month Growth access)	500 images/month, all 4 marketplace presets (Amazon, Zalando, eBay, Etsy), BiRefNet AI on any product type, dual-output processing, organized download by marketplace

Zalando Approval Accelerator	The 6 specific image checkpoints responsible for 80% of Zalando Partner Programme rejections — documented with annotated before/after examples. Includes a one-page pre-submission audit you can run in 5 minutes.
Glass & Jewelry AI Unlock	Expert configuration for glass, jewelry, transparent packaging, reflective surfaces, and dark-background products. Includes the Pre-Upload Photo Quality Checklist that maximizes BiRefNet accuracy before processing begins.

Pre-Submission Safety Net	28-point fillable Google Sheet compliance gate. Run it before any marketplace submission. Auto-highlights are 637 checkpoint that falls below spec. Converts pre-submit hesitation into a documented "all clear."
Zero-Rejection Spec Vault	Complete EU marketplace image blueprint — one reference card per marketplace. Exact pixel dimensions, RC47 values, margin specs, file format requirements. Verify Centyr's output against the published specification yourself.

Catalog Engine SOP Pack	Plug-and-play Notion template + Google Sheets tracker: SKU naming conventions, folder hierarchy, batch upload tracking, new SKU intake workflow, seasonal refresh protocol. Already built — copy it in and use it immediately.
10-Minute Catalog Kickstart Guide	Seven steps from account creation to first compliant image download, displayed on your signup confirmation screen. No documentation to read. No decisions to make.
Total stacked value	€990
Growth tier monthly price	€49/month
Growth tier annual price	€39/month billed as €468/year

The only comparison that matters:

Photo Studio	VA / Fiverr	Centyr Growth Tier
--------------	-------------	--------------------

Cost for €4,000–€10,000 per cycle 200-image catalog	€1,600–€3,000 per cycle	€49/month
Turnaround 5–10 business days	24–72 hours	Under 10 minutes
Amazon. Inconsistent compliance	Inconsistent	Exact specification, every image
Zalando portraitly supported format	Not standard	Automatic, same batch
Glass and manual editing, variable results jewelry	Variable quality	BiRefNet AI, specialist accuracy
Annual cost (2€8,000–€20,000 catalog cycles/year)	€3,200–€6,000	€468

Your annual Growth subscription at €468 costs less than one studio session for 16 images.

At 200 images processed in your first month: your ROI is 122:1 against studio pricing.

At 500 images per month across four marketplaces: you have replaced a workflow that costs hundreds of hours and thousands of euros per year with a 10-minute batch process.

Start with your free 25 images. See the output before you pay anything.

7. Proof Section

Section heading: What to Expect From Your Free Trial

No testimonials on this page yet — because Centyr is built for sellers who have been burned by tools that overpromised and underdelivered. We are not asking you to trust a claim. We are asking you to test the output on your own products.

Here is what the trial experience looks like:

You upload 5 of your most difficult products — the ones you are most worried about. Glass bottles with reflections. Gold jewelry with fine chain detail. Transparent labels. Shiny packaging. Whatever your hardest product type is.

You click Process Batch.

Sixty seconds later, you see the first preview.

You open the /Amazon folder. You see your product centered on a pure white background, at exactly 2000×2000 pixels, with the correct margin. You open the /Zalando folder. The same product, in portrait orientation at 1500×2250 pixels, with Zalando's 12% margin applied.

You check the edges on the glass bottle. The reflection is preserved. The transparency is accurate. The background is clean.

That is the proof. Not a claim on this page. Your own products, processed correctly, in front of you, before you pay anything.

If the output does not look exactly right on your most challenging products — we do not want your money. The free trial is designed so that you arrive at a paid subscription because the product has already proved itself to you, not because we convinced you with copy.

What the BiRefNet AI handles (use the free trial to verify this on your own catalog):

Complex glass and crystal products — backgrounds removed with transparent accuracy on surfaces with reflections, gradients, and partial opacity.

Gold, silver, and gemstone jewelry — fine edges recovered on chain links, clasps, prongs, and faceted stones where generic tools produce fringe artifacts.

Transparent and frosted packaging — partial transparency preserved rather than removed or filled incorrectly.

Reflective metallic and lacquered surfaces — background separated cleanly from the product surface without destroying the product's finish or sheen.

Dark-background products — edge detection maintained even at the low-contrast boundaries that cause standard AI models to fail.

Upload your 10 hardest products in the free trial. If BiRefNet handles those, it handles everything else in your catalog.

8. Objection Handling

"I already tried AI background removal tools — they messed up my edges and my images were rejected."

Most AI background removal tools are trained on simple products and fail at complex surfaces. BiRefNet uses a different architecture that specifically handles the edge-detection problems that generic tools cannot solve — glass, jewelry, transparent materials, reflective packaging. These are not edge cases for Centyr. They are the product types the AI was built for. Upload your specific products in the free trial. If the output passes your visual inspection, you have your answer. If it does not, you have paid nothing.

"I already have a workflow — a VA or a studio I'm working with."

Map the actual cost of that workflow:

Studio at €30/image × 200 products = €6,000 per catalog cycle. Plus 5–10 business day wait time. Plus the images that still come back needing corrections because the studio did not know Zalando's portrait specification.

VA at €10/image × 200 products = €2,000 per cycle. Plus briefing overhead, correction rounds, and rejection notices for the images where the margin drifted or the centering was slightly off.

Centyr: €49/month. Under 10 minutes per catalog cycle. Same specification applied to every image. No briefing. No correction rounds. No per-image cost.

You do not need to abandon your current workflow to try Centyr. Process your next batch of new SKUs — 25 images are free. Run both in parallel. Compare the output, the time, and the cost. You will not go back.

"What if the AI cannot handle my specific products — I sell [glass / jewelry / accessories with complex shapes]?"

Glass and jewelry are not exceptions to Centyr's capability — they are the showcase for it. Upload your 10 most difficult products in the free trial. Glass bottles with reflections. Gold chains. Crystal glassware. Transparent packaging. The Glass & Jewelry AI Unlock bonus (included with Growth tier) also covers expert configuration for six specific complex product types, with a pre-upload photo checklist that maximizes BiRefNet accuracy on your specific product category. Start with the hardest products you have. If those come back clean, the rest of your catalog is answered.

"What if Centyr processes my images correctly and Zalando still rejects my application for other reasons?"

This is the exact concern the Zalando Approval Accelerator bonus was built for. The accelerator documents all six image requirements Zalando enforces during Partner Programme review — not just format and dimensions, but background tone range, product placement within the frame, shadow and reflection handling, watermark restrictions, and file format and compression requirements. It covers the full compliance surface, not just the format conflict. The Pre-Submission Safety Net (also included) lets you verify every checkpoint before you submit. If you run both, you are not guessing about compliance — you are verifying it point by point before the portal sees your images.

"It is too expensive — I am already paying for too many tools."

Centyr is not an additional tool cost. It is a direct replacement for a larger cost that is already there.

Your last studio invoice for a catalog cycle: €4,000–€10,000. Your last Fiverr batch for 200 edited images: €1,600–€3,000. Your annual Centyr Growth subscription: €468.

The question is not whether €49/month is affordable. The question is what your current workflow costs per year and whether that is still acceptable now that you know what the alternative costs. At €49/month, Centyr pays for itself on the third image you process in a given month against any alternative.

"I don't need all four marketplaces — I only sell on Amazon and Zalando right now."

You only activate the presets you use per batch. Unused presets cost you nothing. Amazon and Zalando are pre-checked by default — if those are the only two you select, those are the only two outputs you receive. The other presets exist so that when you expand to eBay or Etsy, the format problem is already solved — no new workflow, no additional tool, one extra checkbox. If you are only on one marketplace today, the Starter tier at €19/month is the appropriate entry point.

9. Guarantee Section

Section heading: The Zero-Rejection First Batch Guarantee

Process your first 25 images completely free.

No credit card required. No time limit. No watermarks or reduced-quality previews — the free trial outputs are at full processing quality, in the exact formats you would receive as a paid subscriber.

If the output does not meet Amazon's and Zalando's exact published specifications — correct pixel dimensions, correct background color (RGB 255,255,255 for Amazon), correct margin percentages, correct portrait orientation for Zalando — you do not pay. Ever.

We earn your subscription by proving the output before you commit to anything.

Once you subscribe: if any paid batch produces more than 2 images rejected by Amazon or Zalando for image compliance reasons, send us the rejection notice. We will reprocess your entire batch at no charge — or refund your payment in full. Your choice. You cannot walk away with less than you arrived with.

10. CTA Section

Section heading: Your Zalando Catalog Is 10 Minutes Away From Being Submission-Ready

Every week without a compliant Zalando catalog is a week competitors who solved this problem before you are accumulating the listing age and review velocity that determine organic position on a platform where early-entrant advantage compounds permanently.

This is not urgency manufactured for a sales page. This is how Zalando's algorithm works. The sellers who launched 12 weeks ago have a ranking advantage today that cannot be eliminated by a better product — only by time. Time you are losing while the application waits.

Your first 25 images are free. Your first result is visible in 60 seconds. Your Zalando application image set can be ready to submit today.

CTA Button: Process My First 25 Images Free

Zero-Rejection First Batch Guarantee — No credit card required — First result in 60 seconds

Pricing (displayed below CTA):

Starter — €19/month 100 images/month | All 4 marketplace presets | BiRefNet AI processing | Organized download by marketplace
Best for: Solo sellers with fewer than 50 SKUs who process images once or twice per season. Annual: €15/month billed as €180/year

Growth — €49/month ← Most Popular 500 images/month | All 4 marketplace presets | Priority processing queue | Full bonus stack (Zalando Approval Accelerator, Glass & Jewelry AI Unlock, Pre-Submission Safety Net, Zero-Rejection Spec Vault, Catalog Engine SOP Pack, 10-Minute Kickstart Guide) Best for: FBA sellers with 50–500 SKUs who are managing seasonal updates, Zalando expansion, or both. This is the tier that replaces the studio. Annual: €39/month billed as €468/year — save €120

Agency — €99/month 2,000 images/month | All 4 marketplace presets | Multiple client workspace folders | White-label export file naming | Priority email support | 2 team seats Best for: Photography studios, e-commerce agencies, and catalog management services handling five or more client accounts simultaneously. Annual: €79/month billed as €948/year

CTA Button (repeated): Process My First 25 Images Free

11. FAQ

Q: Do I need to reshoot my products to use Centyr? A: No. Centyr is designed specifically to convert your existing product photos — including photos already processed for Amazon in square format — into compliant images for every other marketplace. Upload your raw studio photos, your existing Amazon images, or any product photo you already have. Centyr removes the background and reprocesses for the marketplace formats you select. The vast majority of users do not reshoot anything.

Q: Will Centyr's output actually pass Amazon and Zalando's review, or is it just "close"? A: Centyr applies the exact published specifications programmatically to every image: Amazon at 2000×2000px, RGB 255,255,255 background, 5% margin; Zalando at 1500×2250px, 12% margin, portrait 2:3. These are not approximations — they are the same values Amazon and Zalando publish as their requirements, applied identically to every image in every batch. The free trial lets you verify the output on your own products before committing. If the output does not meet the exact specification, you are covered by the Zero-Rejection First Batch Guarantee.

Q: What happens with complex products — glass, jewelry, products with transparent packaging? A: These are the product types BiRefNet AI was specifically designed to handle. Upload your glass bottles, jewelry, and transparent products as your free trial batch — start with your hardest ones. The Glass & Jewelry AI Unlock bonus (included with Growth tier) also provides expert configuration for six specific complex product categories, including a pre-upload photo quality checklist that maximizes accuracy before processing begins. If the AI handles your most difficult products, the rest of your catalog is solved.

Q: How many images can I process per month on each tier? A: Starter: 100 images per month. Growth: 500 images per month. Agency: 2,000 images per month. Monthly image credits reset on your billing date. If you process more than your monthly limit, you can upgrade tiers at any time or contact us about add-on credit packs. All tiers include all four marketplace presets — you are not paying extra for Zalando versus Amazon, or any other combination.

Q: I only sell on Amazon right now. Is Centyr still useful for me? A: Yes — two reasons. First, Centyr applies Amazon's exact specification (2000×2000px, RGB 255,255,255, 5% margin) consistently to every image in every batch. If you currently use a VA, a studio, or manual editing, you are likely experiencing inconsistencies that cause random Amazon listing suppressions. Centyr eliminates that. Second, the Zalando preset is available immediately when you decide to expand — no new tool, no new workflow, one extra checkbox. The Starter tier at €19/month is the appropriate entry point for single-marketplace use.

Q: What file types does Centyr accept for upload? A: JPG, PNG, HEIC, TIFF, and WebP. Raw files from DSLR cameras (CR2, ARW, NEF) should be converted to JPG or TIFF before upload — the Glass & Jewelry AI Unlock bonus covers recommended export settings for each camera format. Maximum file size per image is 25MB. There is no limit on the total number of files per batch up to your monthly credit allowance.

Q: How long does processing take for a large batch? A: First image preview: approximately 60 seconds from upload. A 25-image batch: approximately 3–5 minutes. A 200-image catalog: approximately 8–12 minutes depending on product complexity and current processing queue. Growth tier subscribers access a priority processing queue, which reduces wait times during peak periods.

Q: What is the difference between the Growth and Agency tiers beyond image volume? A: The Agency tier includes three capabilities not available at Growth: multiple client workspace folders (so images from different brands or client accounts are organized and never mixed), white-label export file naming (output files are named to your or your client's naming conventions rather than Centyr's defaults), and 2 team seats so multiple people in your agency can access the account simultaneously. If you manage product images for more than one brand or client account, the Agency tier eliminates the organizational overhead of managing multiple separate Centyr accounts.

Centyr — Hormozi Value Equation Audit

Offer: Catalog Passport by Centyr

1. Offer Summary

- **Who it's for:** EU Amazon FBA sellers with 50–500 SKUs who are expanding to (or being rejected by) Zalando, with no design team and an existing catalog of product photos that are already square/Amazon-formatted. Secondary: e-commerce agencies managing 5+ client catalogs.
- **What it promises:** One upload of raw product photos generates both Amazon-compliant images (2000×2000, white background, 5% margin) AND Zalando-compliant images (1500×2250, 2:3 portrait, 12% margin) in under 10 minutes — with zero Photoshop, no studio booking, no design skills.
- **How it works:** SaaS web application. Drag raw photos in → BiRefNet AI removes backgrounds → auto-centering with configurable margin → simultaneous output in all selected marketplace presets → download organized folders per platform.
- **Price:** €29–€99/month depending on volume tier (hypothesis stage). Growth tier hypothesis: €59/month or €49/month billed annually. Free trial: 25 images, no credit card.
- **ROI anchor:** €6,000 per 200-product catalog cycle at studio rates (€30/image × 200) vs. €588/year for Centyr = 10:1 ROI in month one.

2. Overall Diagnosis

Strengths: - Segment precision is exceptional. The Amazon-to-Zalando expansion moment is one of the most targetable trigger events in EU e-commerce — calculable financial pain, specific rejection message, confirmed spend on inferior alternatives. Scores 34/40 in market research. - The format conflict positioning (Amazon 1:1 square vs. Zalando 2:3 portrait) is a genuine, verifiable structural differentiator. No identified competitor resolves both specs in a single automated batch. - ROI case is immediately obvious. The €6,000 studio alternative makes even €99/month feel trivial. The ROI is not vague — it is calculable per image and per catalog. - Free trial design (25 images, no credit card) is the right mechanism. It functions as acquisition, trust-building, and objection-handling simultaneously. - Messaging angles are strong at the hook level. The pain-based Zalando rejection hook, studio cost anchor, and blocked inventory angle are all specific and conversion-ready. - Solution map is logically complete — every obstacle has a corresponding product feature.

Critical Weaknesses: - Zero social proof anywhere in the offer structure. No testimonials, no before/after compliance gallery, no pass rate data, no user count. Every prospect must personally experiment before they believe the AI output is good enough. Social proof would shorten this gap for a significant portion of visitors who won't click a free trial without some external validation. - Bonus stack is entirely informational. All five bonuses are described as PDFs, guides, and checklists — formats associated with free lead magnets, not premium deliverables. This undermines the stated total bonus value of €225 and weakens the perceived value of the entire stack. - Three guarantee options without a committed choice. Internally this is a strategy decision; externally it produces vague messaging. No live guarantee statement currently exists on the product. - Pricing is still a range. A €29–€99 spread signals that the offer isn't finalized, which weakens anchoring on any page that attempts to show ROI. - Live hero copy is underperforming relative to the best angles developed in OFFER_ANGLES.md. The gap between documented strategy and live execution represents immediate, measurable conversion loss.

3. Value Equation Analysis

Dimension	Score	Key Issue	Fix
-----------	-------	-----------	-----

Dream Outcome	8/10	Outcome is specific, emotional, and financially anchored ("never rejected again," "€6,000 saved"). Gap: the claim has no proof mechanism attached to it — it is a promise without a named delivery structure	Create a named system for the outcome: "The Zero-Rejection Processing System" — give the mechanism a name so the result feels like a guaranteed product, not an aspiration
Perceived Likelihood	5/10	No social proof, no pass rate data, no before/after showing actual Amazon or Zalando acceptance results. The trust gap on AI output quality is explicitly documented in OFFER.md as a known obstacle — but it remains unresolved in the offer structure	Build a proof layer immediately: 6–8 before/after image pairs for complex products (glass, jewelry, shiny packaging), a processing volume counter ("X,XXX images processed"), and at least 1–2 quoted results from real users as soon as they exist
Time Delay	7/10	Processing speed is strong ("first image in 3 minutes, full 200-product catalog in under 10 minutes"). Gap: the defined first win is image download — but the buyer's emotional first win is a listing going live without rejection. That downstream moment is unaddressed in onboarding	Add a post-download bridge: "Your images are ready. Here is how to upload to Amazon Seller Central in the next 15 minutes." Day 1 = download + first live listing, not just download
Effort & Sacrifice	7/10	Effort reduction is well-designed (no skills, no install, drag-upload-download in same session). Gap: there is no documented onboarding sequence that removes the "what do I do first after I sign up" ambiguity for a first-time user	Design and deploy a First Session Guide — not a tutorial document, but a literal in-app "do this exact thing in the first 10 minutes" guided sequence
Market Fit	9/10	Best-in-class segment precision. Pain is financial, calculable, recurring, and urgent. Confirmed purchasing power (these sellers already spend €4,000–€10,000/catalog cycle at studios). Clear trigger event. Minor gap: the fashion/apparel brand entering Zalando is an equally strong avatar that shares identical pain	Secondary audience: EU fashion brand entering Zalando Partner Programme (scored 32/40 in market research). Can be activated with same core messaging, slight copy variation
Offer Structure	7/10	Logically organized. Main structural problem: three guarantee variants are documented as "options" without committing to one, which produces vague messaging externally. Additionally, the "one upload → dual format output" capability — the central differentiator — gets buried in a bullet list instead of being the organizing principle of the offer	Name and commit to one guarantee publicly. Restructure offer presentation so the dual-output mechanism is the frame, not a feature

Value Stack	6/10	All five bonuses are informational documents. Perceived value of "cheat sheets," "checklists," and "guides" is inherently low even when the content is high-value. The total stacked value claim of €933 is difficult to believe when four of five bonuses are described as PDFs. The real value comparison — €6,000 studio alternative — is more powerful than the stacked value number but is currently subordinated to it	Upgrade at least two bonus components from information to execution: replace descriptive guides with plug-and-play operational assets (templates, pre-built SOPs, ready-to-use tools). Surface the studio cost comparison as the primary value anchor above the stack
Pricing	7/10	ROI case is strong and specific. Gap: the €29–€99/month range is still a hypothesis. The offer cannot fully commit a price anchor until one price is committed. A range tells the prospect "we are still figuring this out." A single firm price with clear tier differentiation tells them "this is what it costs and here is what you get"	Commit to three tiers with specific image volume thresholds. Recommended public price: €59/month (Growth), positioned as "less than the cost of 2 studio images per month." Annual tier at €49/month creates the natural upsell
Messaging	8/10	Hook-level copy is strong and differentiated. The pain-based Zalando rejection hook is specific enough to trigger immediate recognition in anyone who has received that rejection notice. Gap: the live hero copy ("The Right Format for Amazon, eBay, Etsy and Zalando — Automatically") does not match the documented strategy — it is a convenience framing where the strategy calls for a pain-activation framing	Deploy the Zalando rejection hook as the live H1 immediately. This is a copy change with no development dependency and the highest expected conversion impact of any single change available
Objections & Trust	5/10	Five objections are identified and scripted. The free trial handles the primary one (AI output quality). The conditional guarantee handles the worst-case scenario. Neither the guarantee, social proof, nor complex-product demonstration is visible above the fold. Trust signals exist in the strategy but are not deployed on the live product	Three deployments needed: (1) Complex product before/after above the fold — glass or jewelry, raw vs. Centyr output. (2) Named guarantee in the hero section below the CTA. (3) Image processing volume counter anywhere on the homepage

Overall Score: 69/100

4. Top 3 Priority Fixes

Fix 1 — Build the proof layer before any paid acquisition (Impact: Highest / Fixes Perceived Likelihood + Objections & Trust)

The offer has no social proof and scores 5/10 on both Perceived Likelihood and Objections & Trust. Every prospect who does not already know Centyr must personally experiment before they believe the AI output is marketplace-compliant. Social proof eliminates this requirement for a significant portion of visitors — they believe because others have already verified.

Specific actions: - Publish 6–8 before/after image pairs for complex product types (glass bottle, gold jewelry, transparent packaging, shiny metallic surfaces, dark background). Each pair shows: raw photo → Centyr output → "Submitted to Amazon / Accepted" or "Submitted to Zalando / Accepted." - Add a processing volume counter to the homepage. Even a low real number — "4,200 marketplace images processed" — signals the product is in use and trusted. Zero counter signals zero adoption. - Collect the first real user quote at the first opportunity. One specific sentence from a real seller ("Processed 150 SKUs in 40 minutes, all accepted on first Zalando submission — [Name], Amazon seller, IT") outperforms a full paragraph of product copy. - If no user testimonials exist yet: publish a

BiRefNet AI pass rate statistic ("X% of images processed meet marketplace compliance specifications on first submission") — a data point backed by batch testing is better than no proof.

This fix should be in place before any paid acquisition budget is spent.

Fix 2 — Commit to one guarantee and make it the front-of-offer headline mechanism (Impact: High / Fixes Offer Structure + Trust)

Three guarantee options is an internal strategy artifact. Externally it produces no guarantee at all because none of the three is published or named. The free trial (Option 3) is already the best mechanism — it eliminates all purchase risk by letting results prove themselves before any money changes hands.

Specific actions: - Name the guarantee: "The Zero-Rejection First Batch Guarantee — Process your first 25 images free. No credit card. If the output isn't marketplace-compliant, you don't pay. Ever." - This named guarantee becomes the primary CTA, the primary risk reversal, and the primary acquisition hook simultaneously. It belongs in the hero section, below the CTA button, and repeated near any pricing display. - For active paid subscribers, deploy the conditional guarantee (Option 2 from OFFER.md) as a post-purchase retention layer: "If more than 2 images in any paid batch are rejected by Amazon or Zalando for compliance reasons, we reprocess the entire batch free — or refund you." Communicate this post-signup, not on the acquisition page.

Fix 3 — Upgrade the bonus stack from documents to execution assets (Impact: Medium-High / Fixes Value Stack + Effort Reduction)

Documents feel free. Tools feel valuable. When every bonus in a €225 stack is described as a "cheat sheet," "checklist," or "guide," the stated value is unconvincing — these are formats prospects associate with opt-in lead magnets. At least two bonuses should do the work for the buyer rather than inform them.

Specific actions: - Upgrade "Catalog Launch Checklist" (€27) to a "Pre-Submission Safety Net" — a fillable Google Sheet that auto-checks each processed image against Amazon and Zalando's compliance criteria. The buyer fills in their file names, the sheet flags anything below spec. It does the audit for them rather than telling them how to audit. - Upgrade "Seasonal Catalog Workflow Template" (€47) to a "Catalog Engine SOP Pack" — a ready-to-use Notion or Google Sheets template with pre-built naming conventions, folder structures, upload tracking, and per-platform status columns. Not a guide on how to build this — the built system, ready to copy and use. - For the first 30–50 subscribers, consider adding a high-perceived-value bonus service: "Zalando Partner Programme Image Audit" — manual review of their first processed batch before submission by a Centyr team member. Estimated perceived value: €150+. Actual operational cost: 20 minutes per batch. This is the single highest-trust conversion accelerator available at early stage.

5. Quick Wins (implement immediately, no development required)

- Replace the live hero headline with the pain-based H1: "Zalando rejected your images because they're square. Your Amazon catalog is already the reshoot. Upload once — get both formats in under 10 minutes." This is a copy change with zero development dependency.
- Add "No credit card required. First 25 images free." as badge text directly below every CTA button. This removes the unstated objection (fear of being charged) before it forms.
- Name the guarantee in the primary CTA button copy. "Process Your First 25 Free — Zero-Rejection Guarantee" outperforms "Start Free Trial" because it answers the primary objection in the action itself.
- Publish one complex product before/after image above the fold on the homepage. Glass or jewelry. Raw vs. Centyr output. No text required — the image answers the highest-frequency objection before it is raised.
- Add a processing volume counter anywhere on the homepage. Any real number creates the signal that the product is in active use.
- Surface the €6,000 studio comparison explicitly at the pricing point: a two-column visual — "Photo studio for 200 products: €6,000 / 5–10 business days / inconsistent results" vs. "Centyr: €59/month / 10 minutes / guaranteed compliant output."
